Chester, VA 23836

Re: Operable Unit 3 (Uplands) Human Health Risk Assessment (HHRA): LCP Chemical National Priorities List Site, Brunswick, Glynn County, GA

Dear Mr. Gupta:

Through a February 24, 2009, letter, EPA commented on deficiencies found in the August 2008 draft of the referenced document. The HHRA was revised and resubmitted to EPA and received in these offices on March 29, 2009. Though a June 22, 2009 letter EPA provided comments on the March 2009 draft. During July through August 2009, a number of meetings were held to discuss the data set to be used in the HHRA. On September 8, 2009, a final meeting was held in these offices to discuss the data set, with an understanding that EPA and the Georgia Department of Environmental Protection (GaEPD) would jointly provide the provisional peer reviewed toxicity values (PPRTVs) for certain compounds. In addition, EPA was to provide surrogates for a number of analytes.

Enclosed is a table containing the final surrogates recommended by both GaEPD and EPA. I understand this is the final information required to revise the March 2009 draft of the OU3 HHRA.

Pursuant to Section VIII of the Administrative Order on Consent for RI/FS for the Site, EPA Docket No. 95-17-C (AOC for RI/FS), please submit the revised HHRA within thirty (30) calendar days of receipt of this letter.

Once both human health and ecological risk assessments are finalized and approved by EPA, I will request the submittal of the OU3 RI Report and the deliverable described under Task 6 (Development and Screening of Remedial Action Alternatives) of the Scope of Work for the RI/FS. EPA and GaEPD will review this submittal and, if necessary, comment on it before requesting the submittal of the Detailed Analysis of Remedial Action Alternatives (Task 7 of the Scope of Work for the RI/FS).

Should you have any questions regarding the preceding, please contact me at (404) 562-8937.

Sincerely,

Galo Jackson
Remedial Project Manager
South Superfund Remedial Branch

Enclosure

cc: J. McNamara, GaEPD

Parameter	Surrogate
1,1-Dichloropropene	1,3-Dichloropropene
1,2,3-Trichlorobenzene	1,2,4-Trichlorobenzene
2,2-Dichloropropane	1,3-dichloropropane
2-Hexanone	on IRIS (591-78-6)
2-Nitrophenol	2,4-Dinitrophenol
4-Chloro-3-methylphenol	2-Chlorophenol
4-Chlorophenyl-phenylether	Methoxychlor
4-Nitrophenol	2,4-Dinitrophenol
Acenaphthylene	Pyrene
Benzo(g,h,i)perylene	Pyrene
Bromochloromethane	Bromodichloromethane
delta-BHC (HCH)	alpha-BHC (HCH)
Endosulfan I	Endosulfan
Endosulfan II	Endosulfan
Endosulfan sulfate	Endosulfan
Endrin aldehyde	Endrin
Endrin ketone	Endrin
Phenanthrene	Pyrene
p-Isopropyltoluene	Toluene
2-Nitroaniline	listed in RSLT with PPRTV (CASN 88-74-4)
1,3-Dichlorobenzene	1,2-DCB
2,2'-Chloroisopropylether	No recommended surrogate
2,2'-Oxybis(1-Chloropropane)	No recommended surrogate
2-Chloroethyl vinyl ether	No recommended surrogate
3/4-Methylphenol	3-Methylphenol on IRIS
4-Bromophenyl-phenylether	No recommended surrogate
Dimethylphthalate	Screening subchronic reference dose = 0.1 mg/kg-d
Di-n-octylphthalate	No recommended surrogate
Hexadecenoic Acid	No recommended surrogate
Methylethylidene Bicyclooctane [edited spelling]	No recommended surrogate
n-Butylbenzene	Ethylbenzene
n-Propylbenzene	Ethylbenzene
Octahydrotrimethylmethylethylphenanthrenol	No recommended surrogate
sec-Butylbenzene	Cumene (isopropylbenzene)
Tellurium	No surrogate
tert-Butylbenzene	Cumene (isopropylbenzene)
Yttrium	No recommended surrogate
alpha-Chlordane	Chlordane
cis-1,3-Dichloropropene	1,3-Dichloropropene on IRIS (542-75-6)
Dibenzofuran	Screening chronic reference dose = 0.001 mg/kg-d
gamma-Chlordane	Chlordane
Titanium	No recommended surrogate
trans-1,3-Dichloropropene	1,3-Dichloropropene on IRIS (542-75-6)

Re: **Honeywell's Response to EPA's Letter Dated April 6, 2011 regarding "Outstanding Issues from OU3 (Uplands) Baseline Human Health Risk Assessment: LCP Chemical Company NPL Site, Brunswick, Georgia"**

Dear Mr. Jackson:

We are in receipt of EPA's letter dated April 6, 2011, regarding the Outstanding Issues from OU3 (Uplands) Baseline Human Health Risk Assessment (HHRA). The letter directs Honeywell to submit revised soil screening tables used to identify Constituents of Potential Concern (COPC) for each exposure unit (EU) that were attached as Exhibits 1 through 5 to Honeywell's April 21, 2010 correspondence related to the OU3 HHRA submitted to EPA on January 4, 2010.

Updated versions of the COPC screening tables are attached to this letter as Exhibits 1A through 5A. Several of the column headers and footnotes have been modified to improve clarity and these tables also incorporate the EPA's November 2010 Regional Screening Levels (RSLs) for residential soil. The RSL values that have changed since the submission of January 2010 HHRA are highlighted. Although there were a total of 53 changes to RSL values, most were relatively minor and the only substantive changes to the identification of COPC was the addition of chromium as a COPC in every EU, the addition of vanadium as a COPC in Quadrant 2, and elimination of 1,3,5-Trimethylbenzene as a COPC in Quadrants 3 and 4.

With respect to chromium, we note that the change to the RSL is based on the use of an oral cancer slope factor (CSF) for hexavalent chromium developed by the state of New Jersey. The EPA's Integrated Risk Information System (IRIS) program is also in the process of conducting a cancer risk assessment for hexavalent chromium, but the methodology and results of this assessment are scientifically controversial and it is unclear when the EPA's assessment will be finalized or what conclusions will be reached. The site analytical data generated to date

report "total chromium" and do no not provide information on the relative proportions of trivalent and hexavalent forms of chromium. Depending on the results of the risk characterization, collection of chromium speciation data may be warranted to evaluate the relative proportions of trivalent and hexavalent forms of chromium.

Exhibits 1B through 5B are secondary tables for each EU that apply the EPA-recommended "screening refinement" elements to the "B-flagged" constituents identified in Exhibits 1A through 5A. These refinement elements include elimination of B-flagged constituents as COPC based on the following criteria:

1. Less than 10% of the data records in an EU with detection limits (DLs) below EPA's "medium" Contract Required Quantitation Limit (CRQL); or
2. Less than 5% of the data records in an EU with DLs exceeding EPA's RSLs for residential soil.[1]

For constituents that remain after the two criteria above are applied, EPA provided three additional refinement criteria that may be used to eliminate COPC. These include:

3. No past use of the constituent at the site;[2]
4. No detections in samples from material that was excavated in the removal action; and 10 or more data records from fixed-based analytical laboratories (*i.e.*, Level IV data) with DLs below EPA's RSL for residential soil.

Honeywell understands that constituents that cannot be eliminated through the application of these screening refinements will be identified as COPC to be addressed qualitatively in the HHRA. The results of the COPC screening process, including the application of the screening refinement elements are discussed below for each EU.

Off-Site Tank Farm (OTF) (Exhibits 1A and 1B)

- 8 constituents were initially identified as COPC based on maximum detected concentrations that exceeded EPA's RSL for residential soil.
- 14 constituents were either not detected or had maximum detected concentrations below the residential RSL, but were evaluated further in the screening refinements because of detection limits that exceeded the RSL. 6 of these 14 constituents were dropped from further consideration based on the application of one or more of the screening refinement criteria.

The 8 constituents remaining after the application of the screening refinement criteria are Aroclors. Several of these Aroclors (*e.g.*, Ar-1232, Ar-1242, and Ar-1248) have never been detetected in samples from the site and were dropped as COPC from all of the other EUs based

[1] RSLs for noncarcinogens were adjusted to a hazard quotient of 0.1 throughout the COPC screening process.

[2] Honeywell has only used this criteria to "screen out" thallium in the analysis presented here, but it reserves the right to investigate this criteria in the future should further action be required for any of the constituents carried into the HHRA as qualitative COPC.

on one or more of the screening refinement elements. Nevertheless, these 8 Aroclors will be retained as COPC for the OTF EU for qualitative treatment in the HHRA.

Quadrant 1 (Exhibits 2A and 2B)

- 15 constituents were identified as COPC based on maximum detected concentrations that exceeded EPA's RSL for residential soil.
- 24 constituents were either not detected or had maximum detected concentrations below the residential RSL, but were evaluated further in the screening refinements because of detection limits that exceeded the RSL. 19 of these 24 constituents were dropped from further consideration based on the application of one or more of the screening refinement criteria.[3]

The 5 remaining constituents include: 4,6-dinitro-2-methylphenol, bis(2-chloroethyl) ether, hexachlorobenzene, N-nitroso-di-n-propylamine, and pyridine. These constituents will be retained as COPC for the Quadrant 1 EU for qualitative treatment in the HHRA.

Quadrant 2 (Exhibits 3A and 3B)

- 16 constituents were identified as COPC based on maximum detected concentrations that exceeded EPA's RSL for residential soil.
- 15 constituents were either not detected or had maximum detected concentrations below the residential RSL, but were evaluated further in the screening refinements because of detection limits that exceeded the RSL. All 15 of these constituents were dropped from further consideration based on the application of one or more of the screening refinement criteria.

Quadrant 3

- 33 constituents were identified as COPC based on maximum detected concentrations that exceeded EPA's RSL for residential soil.
- 52 constituents were either not detected or had maximum detected concentrations below the residential RSL, but were evaluated further in the screening refinements because of detection limits that exceeded the RSL. 51 of these 52 constituents were dropped from further consideration based on the application of one or more of the screening refinement criteria.

The remaining constituent, 1,1-Dichloropropene, will be retained as COPC for the Quadrant 3 EU for qualitative treatment in the HHRA.

[3] One of the 19 constituents is thallium, which occurs naturally in soil, had a low number of true detects in any given EU, and is not known to have been used at the site. In addition, the RSL used for COPC screening was removed from the EPA's RSL tables as of the December 2009 edition because the oral reference dose (Rfd) was withdrawn from the IRIS database based on EPA's determination that the available data "are not adequate to develop an RfD." Based on these factors, thallium was dropped from further consideration in the HHRA.

EPS

Quadrant 4

- 27 constituents were identified as COPC based on maximum detected concentrations that exceeded EPA's RSL for residential soil.
- 35 constituents were either not detected or had maximum detected concentrations below the residential RSL, but were evaluated further in the screening refinements because of detection limits that exceeded the RSL. All 35 of these constituents were dropped from further consideration based on the application of one or more of the screening refinement criteria.

Summary

Thank you for the opportunity to provide EPA with this set of updated COPC screening tables. We look forward to finalizing the list of COPC and moving forward to complete the HHRA Report for OU#3. As always, please do not hesitate to contact me at (678) 336-8544 if you have any questions.

Sincerely,

Kirk Kessler

285												
286					Warning: There are only 3 Distinct Detected Values in this data set							
287					The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.							
288					Those methods will return a 'N/A' value on your output display!							
289												
290					It is necessary to have 4 or more Distinct Values for bootstrap methods.							
291					However, results obtained using 4 to 9 distinct values may not be reliable.							
292					It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General Statistics			
Number of Valid Data	11	Number of Detected Data	2
Number of Distinct Detected Data	2	Number of Non-Detect Data	9
		Percent Non-Detects	81.82%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.15	Minimum Detected	-1.897
Maximum Detected	0.204	Maximum Detected	-1.587
Mean of Detected	0.177	Mean of Detected	-1.742
SD of Detected	0.0385	SD of Detected	0.219
Minimum Non-Detect	0.35	Minimum Non-Detect	-1.05
Maximum Non-Detect	6.8	Maximum Non-Detect	1.917

Note: Data have multiple DLs - Use of KM Method is recommended	Number treated as Non-Detect	11
For all methods (except KM, DL/2, and ROS Methods),	Number treated as Detected	0
Observations < Largest ND are treated as NDs	Single DL Non-Detect Percentage	100.00%

Warning: Data set has only 2 Distinct Detected Values.

This may not be adequate enough to compute meaningful and reliable test statistics and estimates.

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

	A	B	C	D	E	F	G	H	I	J	K	L
1962	Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.											
1963												
1964	The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.											
1965	Those methods will return a 'N/A' value on your output display!											
1966												
1967	It is necessary to have 4 or more Distinct Values for bootstrap methods.											
1968	However, results obtained using 4 to 9 distinct values may not be reliable.											
1969	It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

	A	B	C	D	E	F	G	H	I	J	K	L
266	Warning: Data set has only 2 Distinct Detected Values.											
267	This may not be adequate enough to compute meaningful and reliable test statistics and estimates.											
268	The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).											
269												
270	Unless Data Quality Objectives (DQOs) have been met, it is suggested to collect additional observations.											
271												
272	The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.											
273	Those methods will return a 'N/A' value on your output display!											
274												
275	It is necessary to have 4 or more Distinct Values for bootstrap methods.											
276	However, results obtained using 4 to 9 distinct values may not be reliable.											
277	It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

339												
340	Note: Data have multiple DLs - Use of KM Method is recommended									Number treated as Non-Detect		26
341	For all methods (except KM, DL/2, and ROS Methods),									Number treated as Detected		1
342	Observations < Largest ND are treated as NDs									Single DL Non-Detect Percentage		96.30%
343												
344	Warning: There are only 3 Distinct Detected Values in this data set											
345	The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.											
346	Those methods will return a 'N/A' value on your output display!											
347												
348	It is necessary to have 4 or more Distinct Values for bootstrap methods.											
349	However, results obtained using 4 to 9 distinct values may not be reliable.											
350	It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

286												
287						Warning: There are only 3 Distinct Detected Values in this data set							
288						The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.						
289						Those methods will return a 'N/A' value on your output display!						
290												
291						It is necessary to have 4 or more Distinct Values for bootstrap methods.						
292						However, results obtained using 4 to 9 distinct values may not be reliable.						
293						It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

General Statistics

Number of Valid Data	118	Number of Detected Data	15
Number of Distinct Detected Data	3	Number of Non-Detect Data	103
		Percent Non-Detects	87.29%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.0275	Minimum Detected	-3.594
Maximum Detected	0.03	Maximum Detected	-3.507
Mean of Detected	0.0294	Mean of Detected	-3.526
SD of Detected	0.00103	SD of Detected	0.0359
Minimum Non-Detect	0.00009	Minimum Non-Detect	-9.316
Maximum Non-Detect	11	Maximum Non-Detect	2.398
Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	118
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	0
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	100.00%

Warning: There are only 3 Distinct Detected Values in this data set

The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.

Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values for bootstrap methods.

However, results obtained using 4 to 9 distinct values may not be reliable.

It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.

	General UCL Statistics for Data Sets with Non-Detects	
User Selected Options		
From File	C:\Documents and Settings\swebersnapp\Desktop\LCP_OU3_HHBRA\August2010\Industrial Files\ProUCL_Inpu	
Full Precision	OFF	
Confidence Coefficient	95%	
Number of Bootstrap Operations	2000	

1,1,2,2-Tetrachloroethane

General Statistics

Number of Valid Data	103	Number of Detected Data	0
Number of Distinct Detected Data	0	Number of Non-Detect Data	103
		Percent Non-Detects	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 1,1,2,2-Tetrachloroethane was not processed!

1,4-Dichlorobenzene

General Statistics

Number of Valid Data	102	Number of Detected Data	0
Number of Distinct Detected Data	0	Number of Non-Detect Data	102
		Percent Non-Detects	100.00%

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 1,4-Dichlorobenzene was not processed!

1,2,4-Trimethylbenzene

General Statistics

Number of Valid Data	81	Number of Detected Data	16
Number of Distinct Detected Data	15	Number of Non-Detect Data	65
		Percent Non-Detects	80.25%

Raw Statistics		Log-transformed Statistics	
Minimum Detected	0.06	Minimum Detected	-2.814
Maximum Detected	17	Maximum Detected	2.833
Mean of Detected	4.397	Mean of Detected	-0.278
SD of Detected	5.921	SD of Detected	2.308
Minimum Non-Detect	0.00009	Minimum Non-Detect	-9.316
Maximum Non-Detect	0.11	Maximum Non-Detect	-2.207
Note: Data have multiple DLs - Use of KM Method is recommended		Number treated as Non-Detect	71
For all methods (except KM, DL/2, and ROS Methods),		Number treated as Detected	10
Observations < Largest ND are treated as NDs		Single DL Non-Detect Percentage	87.65%

APPENDIX G

UNCERTAINTY ASSESSMENT – AROCLOR 1268 TOXICITY

Appendix G
Toxicity Assessment of Aroclor 1268

Aroclor 1268 Uncertainty Analysis

The IRIS database does not contain an oral cancer slope factor (CSFo) or an oral reference dose (RfD) specific to Aroclor 1268. Therefore, as a conservative measure, the EPA and GaEPD required the use of Aroclor 1254 toxicity values (the most toxic form of Aroclor) as a surrogate for Aroclor 1268 (also for Aroclor 1248 and Aroclor 1260) in the HHBRA. It is feasible, based on current peer-reviewed literature, that this approach of applying toxicity values not specific to Aroclor 1268 in this assessment presents an element of uncertainty, specifically an overestimate of perceived risk.

Acknowledging IRIS does not contain toxicity values specific to Aroclor 1268, this appendix provides a review of current literature peer-review literature specific to Aroclor 1268 toxicity. It is understood that the Aroclor 1268 toxicity values from the peer-reviewed literature have not been evaluated by EPA's IRIS assessment review and are not established Provisional Peer Reviewed Toxicity Values.

Literature Results

Literature values for Aroclor 1268 are available in the peer-reviewed literature based on Modes of Action (MOAs) and congener composition. These values are presented herein and used to derive a set of risk characterization results as a point of reference with regard to the current scientific opinion of Aroclor 1268 toxicity.

Comparison of Aroclor (PCB Congener) Metabolism and Persistence

Prior to evaluating the relative toxicity of Aroclors as determined by an evaluation of the Aroclor's congeners MOAs, the relative congener composition and persistence of specific congeners is required.

Data for metabolism and persistence of PCB congeners were obtained from Park et al. (2007) who examined the serum PCB concentrations in 87 human volunteers. The most abundant congener in human serum is PCB153, which had an average concentration of 39.2 ng/g-lipid and comprised 22.6% of the total serum PCB concentration. Table 1 shows the lipid-normalized concentrations of all PCB congeners detected in the serum along with the distribution. The last column in Table 1 labeled "Relative Persistence" is the ratio between the serum concentration of each congener and that of PCB153. The derived ratio is a

measure of the bio-persistence of each congener in the body relative to PCB153. These values are analogous to the familiar "TEF" scheme for the dioxin-like properties of PCBs.

It is noted that the recent study of Park et al. (2007) is consistent with the only other quantification of PCB congeners in human tissue. In the 1990s, bioaccumulation and metabolism of PCBs was quantified based on examination of tissue concentrations in relatively lightly exposed capacitor workers versus heavily exposed Yusho and Yucheng patients (Brown et al., 1989; Lawton et al., 1985). A comparison of relative bio-persistence from these studies appears to predict quite well the observed relative serum concentrations in Park et al. (2007) supporting the relative persistence model. The relative persistence model is used to examine and compare the toxicity of the Aroclor mixtures' MOA.

PCB Mode of Action

The relative toxicity of the three Aroclors was evaluated by comparison of MOA of each persistent congener from the three Aroclors. To examine the potential similarities between the three Aroclors, three MOAs were considered:

- a dioxin-like MOA characterized by binding to the aryl hydrocarbon receptor and quantified by dioxin TEQs (Van den Berg et al., 2006);
- an MOA based on binding to the ryanodine receptor and consequent interference with cellular calcium homeostasis (Pessah et al., 2006; Simon et al., 2007; and
- an MOA based on binding to trans-thyretin, a plasma thyroid binding protein, and subsequent increase metabolism of thyroxin (Chauhan et al., 2000).

For each MOA, the value of the relative potency of each congener was multiplied by the relative persistence of that congener and the congener concentration in Aroclor 1016, Aroclor 1254 and Aroclor 1268. The congener composition of Aroclor 1016 was obtained as the average percentage from Anderson (1991) and Frame et al. (1996). The congener composition of Aroclor 1254 was obtained as the average percentage from Anderson (1991), Frame et al. (1996) and Kodavanti et al. (2001). The congener composition of Aroclor 1268 was obtained from Anderson (1991). Detailed Aroclor compositions are shown in Table 2.

A summary of congener composition relative to this Addendum is shown in Table 3 for all congeners that persist in the body based on Park et al. (2007) and comprise greater than 0.5% of any of the three Aroclor mixtures. In addition, the dioxin-like congeners PCB77, PCB81, PCB105, PCB114, PCB118, PCB123,

PCB126, PCB156, PCB157, PCB167, PCB169 and PCB189 were included even if they were not persistent or were at very low percent composition values in the Aroclor mixtures.

For each mixture, the sum of these values represented the potential for the particular Aroclor mixture to produce toxicity specific to each MOA. The bottom row of Table 3 shows the amount of each bio-persistent equivalent value in the mixture. As can be seen, Aroclor 1254 has more of each type of bio-persistent equivalent:

- Aroclor 1254 contains at least two orders of magnitude more bio-persistent dioxin TEQ than either Aroclor 1016 or Aroclor 1268;
- Aroclor 1254 contains about one order of magnitude more bio-persistent Ca^{2+} neurotoxic equivalents than Aroclor 1016 and about two orders of magnitude more than Aroclor 1268; and
- Aroclor 1254 contains two orders of magnitude more bio-persistent thyroid hormone equivalents than Aroclor 1016 and four orders of magnitude more than Aroclor 1268.

The result of this persistence and metabolism comparison for the MOAs indicates Aroclor 1268 exhibits less toxicity equivalents than Aroclor 1016 or Aroclor 1254.

Alternative Toxicity Values for Aroclor 1268 (Tier III Values)

On IRIS, the values for the cancer slope factor for PCB mixtures and reference doses are limited to Aroclor 1016 and Aroclor 1254 only. There is available in the peer-reviewed literature both a cancer slope factor value and a reference dose for Aroclor 1268. The peer-reviewed literature would be identified as Tier III in USEPA's hierarchy of toxicity values, OSWER Directive 9285.7-53 (USEPA, 2003).

As stated in OSWER Directive 9285.7-53, priority should be given to sources that provide toxicity information based on similar methods and procedures as those used for Tier I and Tier II, contain values which are peer reviewed, are available to the public, and are transparent about the methods and processes used to develop the values. US EPA Region 4 personnel have requested that the IRIS values be used for the HHBRA and agreed that alternate values could be considered as part of the uncertainty analysis in this Addendum.

The peer-reviewed articles in Regulatory Toxicology and Pharmacology on Aroclor 1268 fulfill these requirements (Warren et al., 2004; Simon et al., 2007).

Therefore, as part of the uncertainty calculations, these literature values are used to calculate an alternative risk level for each quadrant in OU3.

Aroclor 1268 Cancer Slope Factor

The current PCB carcinogenicity assessment is based on dose-response cancer bioassays of Aroclor mixtures performed in rodents in 1996. US EPA used these studies to develop cancers slope factors (USEPA, 1996). Two slope factors were derived – one for high risk and persistence mixtures and the other for low risk and persistence mixtures. The values are 2.0 per mg/kg-day and 0.4 per mg/kg-day respectively. IRIS recommends using the high risk and persistence value for soil contact risk assessment.

The original bioassay on which the set of PCB slope factors presented in IRIS was based indicates that the PCB mixtures were contaminated with polychlorinated dibenzodioxins and polychlorinated dibenzofurans (PCDD/Fs) that also cause hepatocellular carcinoma and hepatocellular adenoma in rats (Mayes et al., 1998). Hence, the slope factors on IRIS for PCBs are incorrect – the fact that the bioassays contained additional dioxin-like chemicals other than the dioxin-like PCBs, and the fact that dioxin-like chemicals cause liver tumors in female Sprague-Dawley rats used in the bioassay make it impossible to determine whether the tumors were caused by dioxin-like PCBs, the other dioxin-like chemicals or the non-dioxin-like PCBs. Therefore, these cancer slope factors may be conservative for use with Aroclor 1268.

Also, note that Aroclor 1268 was not used in the bioassay (Mayes et al., 1998). Warren et al. (2004) used a careful analysis of Aroclor mixture composition to make sense of this confusing picture and recommend a value of 0.27 per mg/kg-day as the cancer slope factor for Aroclor 1268. This value is based on both an Aryl hydrocarbon receptor (AhR) dependent MOA and a non-AhR-dependent MOA. In addition, the value of 0.27 per mg/kg-day was estimated from the Mayes et al. (1998) bioassay data on other Aroclor mixtures.

Given the uncertainty, both scientific and policy, surrounding the carcinogenicity of dioxin-like chemicals, this value of a slope factor for Aroclor 1268 and its basis seem a reasonable choice (NAS, 2006b). In addition, this choice follows the hierarchy of toxicity criteria (USEPA, 2003).

Regarding the dioxin-like properties of some PCB congeners, two points should be made: first, the amounts of these dioxin-like congeners in Aroclor 1268 are much lower than in other Aroclor mixtures; second, the uncertainty surrounding the cancer slope factor for PCBs has been increased by recent analyses of the NTP bioassays for PCB mixtures when compared to the original bioassay of

Aroclor mixtures (Mayes et al., 1998; Gray et al., 2006; NTP, 2006a, 2006b, 2006c; Walker et al. 2005). It is also worth noting that at present, US EPA has reached no consensus on recommended toxicity criteria for dioxin-like chemicals (NTP, 2006b).

Aroclor 1268 Reference Dose

A reference dose value appropriate to Aroclor 1268 was determined by adjusting to the congener composition. This adjustment was based on the binding of PCBs to the ryanodine receptor and a neurotoxic equivalence scheme for PCB congeners similar to the well-known TEF scheme for dioxin-like chemicals was developed (Simon et al., 2007). The reference dose values for Aroclor 1268 ranged from $4x10^{-4}$ to $1x10^{-3}$ mg/kg-day. Adjusting using GI absorption to obtain a dermal reference dose, the resulting value is $3.5x10^{-4}$ mg/kg-day.

Summary

The data and information available from the peer-reviewed literature indicates the relative toxicity of Aroclor 1268 is less than that of the surrogate values applied in the HHBRA. The persistence and metabolism comparison for the MOAs indicates Aroclor 1268 exhibits less toxicity equivalents than Aroclor 1016 or Aroclor 1254, and the toxicity values from the peer-reviewed literature also indicate a lower concern. As such, the calculated risk and hazard for Aroclor 1268 in the HHBRA is considered a point of uncertainty.

UNCERTAINTY ASSESSMENT – PAH SITE VS. BACKGROUND SOIL CONCENTRATIONS

Appendix H
Site and Background PAH Levels

Review of Site and Background PAH Concentrations

Review of the February 2007 OU3 HHBRA indicated some quadrant risk characterizations were artificially elevated due to soil PAHs which are at background compared to the industrialized region of Brunswick. Consequently, a review of the screening process for soil PAH data was completed to account for background levels. The review included data at the national scale, from the regional scale and from peer-reviewed literature applicable to coastal soils for the following PAHs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(ah)anthracene, and indeno(cd-123)pyrene.

It is important to note at this point, that the data from all quadrants at the LCP site are dominated by non-detects for PAHs. The inclusion of PAHs in the HHBRA followed standard EPA procedures for non-detects by applying as a surrogate result value of one-half the detection limit. This point will be discussed in further detail.

Selection of PAH Background Studies

Background data for PAHs from several sources were considered, including data sets from the Center for Disease Control - Agency for Toxic Substances and Disease Registry (CDC-ATSDR) (1995), Electric Power Research Institute (EPRI, 2000), Van Dolah et al. (2005), Sanders et al. (2002) and the 1995 Community Based Environmental Program (CBEP), or “Brunswick Initiative” (BI) . Initially, it was thought that the BI data set would provide the most appropriate comparison due to the geographic proximity of the sampled locations to the LCP site. However, of the 89 samples in this data set, 85 were non-detect values. In addition, the reporting limits varied over more than an order of magnitude and in many instances, were higher than the actual detects. The BI data set also does not contain analyses for dibenz(ah)anthracene, and benzo(b)fluoranthene and benzo(k)fluoranthene were not separated. A summary of the Brunswick data is provided in Table 1.

National data sets from the CDC-ATSDR Toxicological Profile and from EPRI were also considered (CDC-ATSDR, 1995; EPRI, 2000). The CDC-ATSDR data is reported as ranges and the EPRI data is presented as ranges and means

(Table 1). Both the CDC-ASTDR and EPRI data sets exhibit larger concentration ranges and typically higher PAH values than those in the BI data set.

A comparison of normalized percentages of PAHs in all identified background data sets was compared to LCP quadrant data. The comparison indicates PAH distributions in the studies of Van Dolah et al. (2005) and Sanders et al. (200) are the most comparable with the LCP site (Table 2). As a result, the data sets from Van Dolah et al. (2005) and Sanders et al. (2002), which focused on the coastal southeast, were judged most appropriate for site comparisons.

Van Dolah et al. (2005) investigated migration of PAHs from highways into estuarine wetlands in South Carolina. The estuarine wetlands of South Carolina and those of Georgia are quite similar – both include mud flats, tidal creeks and spartina grass. Van Dolah et al. (2005) provided values of total PAH concentrations for several levels of road usage. The average total PAH concentration in highway berm soil was 1.97 mg/kg; the highest value reported was 3.66 mg/kg. Table 3 shows the percentages and calculated concentration for each PAH.

Sanders et al. (2002) measured PAH concentrations and performed a "fingerprint" analysis of PAHs in surficial sediments in the Savannah River to determine sources of PAHs. Use of the percentages from Sanders et al. (2002) is predicated on the model that PAHs occurring in surficial sediments will be derived from soil via sheet flow/runoff or due to similar depositional processes, and the percentages of the various PAH compounds will be similar in soil and sediment.

Comparative Statistics of PAH Background Studies

To develop comparative statistics to the LCP data set the geometric mean (GM) and geometric standard deviation (GSD) for the Van Dolah et al. (2005) and Sanders et al. (2002) data set distributions were estimated with the following equations:

$$\hat{\sigma} = \frac{\ln(p90) - \ln(AM)}{\Psi(0.9)} \qquad \textit{Eq. 1}$$

$$\hat{\mu} = \ln(AM) - 0.5 \cdot \hat{\sigma}^2 \qquad \textit{Eq. 2}$$

GMs and GSDs developed from percentages obtained from both Van Dolah et al. (2005) and Sanders et al. (2002) are shown in Table 3. The GM values for the distributions derived from Sanders et al. (2002) are consistently lower than those

from Van Dolah et al. (2005). The results of Sanders et al. were used to model distributions of PAHs in background as a conservative approach.

Non-Detect Surrogates for PAHs

As noted, data from all quadrants at the LCP site are dominated by non-detects for PAHs. The inclusion of PAHs in the HHBRA followed US EPA procedures and applied one-half the detection limit for non-detect values. Many sample analyses from the early RI phases where performed in on-site labs, which exhibited higher detection limits.

For all the non-detect values for PAHs at the LCP site, the actual concentration is unlikely to be zero because of the ubiquity of PAHs, but the true concentration for a given sample location of non-detect may be much lower than the one-half detection limit value. To obtain distributions of PAH concentrations at each of the four quadrants in OU3, the method of Helsel and Hirsch (2002) using regression methods on ordered data to obtain estimates of the GM and GSD was applied to each of the PAHs in each quadrant. Briefly, the natural logarithms of detections were plotted against Z-scores obtained from the full data set. The intercept of such a plot is an estimator of the logarithm of the GM and the slope is an estimator of the GSD. Table 4 shows the estimated GM and GSD values for the carcinogenic PAHs in each quadrant of the LCP Site.

To determine potential values represented by the non-detect values of each individual PAH in each quadrant, the appropriate number of values were selected at random from the corresponding distributions using a Monte Carlo approach. Values from the Monte Carlo-generated values below the lowest detection were assumed to represent samples below the detection limit. If Monte Carlo-generated values fell below the detection limit of 0.0017 mg/kg, this value was used as a surrogate. The distributions used as background the total PAH soil concentration value from South Carolina highway berms and the percent individual PAH values from Savannah River sediment.

Statistical Comparison of LCP PAH Concentrations to Background

For all chemicals and in all quadrants, the median value of the background sample developed from Sanders et al. (2002) was greater than the median value of that individual PAH on the LCP site. The median values for the four quadrants and corresponding background are shown in Table 5. In some cases, the mean values in some of the quadrants were higher than the corresponding background mean. In these cases, the difference between the two sets values was assessed with the Wilcoxon Rank Sum test. This is a non-parametric analog of the Student's t-test, which uses ranks in lieu of actual values.

In all cases in which the quadrant mean was greater than the background mean, the Wilcoxon Rank Sum Test did not show a significant difference between the two data sets. The overall conclusion is that the PAHs that are present (0 to 4 feet below ground surface) at the site are at or below levels consistent with general anthropogenic background for the southeast Atlantic coast. This analysis was complicated by the large number of non-detects in the site sample; however, this number of non-detects suggests on a qualitative basis that site-related concentrations of carcinogenic PAHs are relatively low.

The results of this screening process suggest the inclusion of PAHs in the HHBRA would include non-site related contributions to the cumulative risk assessment.

[a] Van Dolah et al. (2005) measured benzo(b)fluoranthene and benzo(k)fluoranthene together. Values of 10% and 8% respectively were used to maintain the approximate ratio of percentages between these two compounds as was measured in Sanders et al. (2002).

[b] Van Dolah et al. (2005) did not measure a percentage value for dibenz(ah)anthracene in road berm soil. The value of 0.9 was estimated using the percentages from Sanders et al. (2002).

AM – arithmetic mean
P90 – 90th percentile of distribution
GM – geometric mean
GSD – geometric standard deviation

Note: p-value calculated when Site AM > Background AM
NS - no significant difference
AM – arithmetic mean
