EXECUTIVE SUMMARY

This report was prepared by Environmental Planning Specialists, Inc. (EPS) on behalf of the LCP Site Steering Committee. The report presents the Human Health Baseline Risk Assessment (HHBRA) for the upland soils (Operable Unit (OU) 3) at the former LCP Chemicals facility located in Brunswick, Georgia. This document supersedes the first upland risk assessment prepared by Arcadis Geraghty & Miller (1999); and more recently revised drafts and addenda prepared by EPS (2007, 2008, 2009, 2010, 2011a).

A comprehensive time-critical removal response action was performed across the uplands over the time period of 1994 to 1997. Contaminated soil over more than 30 acres of the site was excavated, disposed of off-site, and excavations backfilled with clean purchased soil. The purpose of this assessment is to define the magnitude and probability of on-site threats to human health posed by post removal action levels of chemicals in soil at the LCP property, under current and potential future land use options.

The main upland area was subdivided into four approximately equal-area parcels or quadrants, for the purposes of creating the smaller exposure units (EUs) as requested by the U.S. Environmental Protection Agency (USEPA) Region 4 (USEPA, 2006). This assessment also includes a fifth EU comprised of the locations of three former off-site refinery storage tanks (i.e., the "off-site tank farm" or "OST"). Constituents of potential concern (COPC) were selected for each EU, using risk-based screening values from the December 2010 version of the USEPA Regional Screening Level (RSL) Tables (USEPA 2010a). Several organic chemicals and inorganics were added to the COPC list compared to previous drafts of the risk assessment, including additional COPC resulting from General Comments of the August 12, 2010 letter from EPA on the review of the January 2010 revised draft of the human health baseline risk assessment (HHBRA). Quantitative risk characterizations were performed for five exposure scenarios: (1) Commercial/Industrial Worker (current/future scenario), (2) Excavation Worker (future scenario), (3) Trespasser (current scenario), (4) Trespasser (future scenario); and (5) Hypothetical Resident (future scenario). EU-specific exposure point concentrations (EPCs) were calculated using USEPA's ProUCL software. Toxicity values were taken from the December 2010 RSL Table (USEPA 2010a) and surrogate chemicals provided by USEPA Region 4 for chemicals not listed in the RSL Table.

Risk estimations were performed according to a "reasonable maximum exposure" (RME) and for a "central tendency exposure" (CTE), consistent with USEPA Region 4 guidelines (USEPA, 1995b). RME utilizes more conservative assumptions regarding the exposure and therefore USEPA Region 4 considers RME as the high end values on which the remedial decision are to be based (USEPA, 2000).

For the Industrial Worker scenario, the computed hazard indices (HIs) under the RME approach result in values at or less than unity (1) for all EUs, which is USEPA's threshold for non-cancer risk. The corresponding theoretical excess lifetime cancer risk (ELCR) under the RME approach for all EUs is within or below the USEPA acceptable risk range of 10^{-6} to 10^{-4} (USEPA, 1990).

For the Excavation Worker scenario, the computed HIs under the RME approach result in values at or less than unity for four of the five EUs, and was 2 for Quadrant 4. The corresponding theoretical ELCR under the RME approach for all EUs is at the low end or below USEPA's acceptable risk range of 10^{-6} to 10^{-4} (USEPA, 1990).

The computed RME HIs for both the current and future Trespasser scenario are well below unity for all EUs. The RME HI values for all EUs are well below unity. The corresponding theoretical ELCR under the RME approach is at the low end or below USEPA's acceptable risk range of 10^{-6} to 10^{-4}.

The computed RME HIs for the hypothetical future Resident are below unity for two of the EUs (northeast part of the site, and the off-site tank farm) and are between 4 and 15 for the other EUs. The corresponding theoretical ELCR for four EUs is within the USEPA's acceptable risk range of 10^{-6} to 10^{-4}, while the computed ELCR for Quadrant 4 is 1×10^{-4}. The computed ELCR for the CTE approach is within the USEPA's acceptable risk range for all EUs. The computed CTE HIs are approximately 50% of the RME HIs, but still above unity in Quadrants 2, 3, and 4.

1 INTRODUCTION

This report, which has been prepared by EPS on behalf of LCP Steering Committee, presents the human health baseline risk assessment (HHBRA) for Upland Soils, Operation Unit 3 of the LCP Chemicals Superfund Site in Brunswick, Georgia. The first HHBRA for the LCP upland soils was prepared by Arcadis Geraghty Miller, Inc. in 1997 and revised in 1999 (Arcadis, 1999). At that time, however, the upland soils and the estuary were linked as one operable unit (OU). In 2005, the U.S. Environmental Protection Agency (USEPA) segregated these areas into two OUs in late 2005, and subsequently requested a stand-alone HHBRA for the upland soils as Operable Unit 3 (OU3).

EPS prepared a stand-alone HHBRA for OU3 in 2007, which largely based on the scenarios and inputs used in the previous (1999) HHBRA, with subsequent addenda to supplement the 2007 document (EPS, 2008, revised 2009). In June 2009, USEPA requested that a new, stand-alone HHBRA be prepared for OU3 in part to incorporate modifications as a result of newer toxicity information available in standard USEPA databases. This HHBRA report represents the fourth revision of that stand alone HHBRA. This revision incorporates formal comments from the USEPA and the Georgia Environmental Protection Division (EPD) on the previous HHBRA submittal (July 21, 2011a) issued in a letter dated January 18, 2012.

This report consists of the following sections:

1. *Introduction*. Report objectives; general approach.
2. *Purpose.* The overall goals of the report.
3. *Pertinent Background Information.* Summary of historical land uses; description of the physical setting; description of the occurrence of chemicals at the property; and summary of environmental investigations.
4. *Risk Characterization.* Description of risk assessment approach; procedures and methods; data evaluation; exposure assessment; toxicity assessment; risk characterization; and uncertainty analysis.
5. *References.*

2 PURPOSE

The overall goal of this baseline risk assessment is to develop essential scientific information that can be used in decision-making regarding the LCP Chemicals property in support of an evaluation of the need for remedial action. To accomplish this goal, the specific objective of this assessment is to quantitatively evaluate whether COPCs detected in post-removal action soils at the property present a potential exposure[1] and health risk[2] to future industrial workers or hypothetical residential users of the property.

The former LCP site property is traversed by easements and physical features that provide a basis to evaluate mixed land use (*e.g.*, combination of commercial/industrial and perhaps less land use) with respect to the risk characterization and remedial goal options (RGOs) derived within this report. This evaluation will be presented in the forthcoming OU3 Feasibility Study report.

[1] Exposure occurs when a person comes into direct contact with a chemical in an environmental medium (*e.g.,* soil, air). Exposure is quantified as the concentration of a chemical contacted in a medium averaged over the duration of the contact.

[2] Health risk is the probability of one or more harmful health effects occurring at either a measured or assumed level of exposure.

3 PERTINENT BACKGROUND INFORMATION

3.1 Site Background and Operational History

The LCP property is located in Brunswick, Georgia and occupies approximately 813 acres.[3] Approximately 133.5 acres comprised the former manufacturing operations at the site (called the 'upland' area), while 670+ acres is occupied by tidal marshlands (Figure 1). The remaining acreage is isolated upland parcels.

The main upland area has been employed for industrial uses since 1919, beginning with the Atlantic Richfield Company (ARCO), who built a petroleum refining operation on the property. In 1937, 1942, and 1950, the Georgia Power Company (Georgia Power) acquired portions of the property. From 1941 to 1955, Dixie Paint and Varnish Company (subsequently the Dixie O'Brien Corporation and eventually a wholly owned subsidiary of the O'Brien Corporation) produced paints and varnishes on a portion of the property south of the Georgia Power site. In the mid 1950's, Allied Chemical (now Honeywell) acquired almost the entire property, and utilized it primarily for the production of caustic solutions, hydrogen gas, and chlorine gas. In 1979, LCP Chemicals-Georgia (LCP) acquired the property and continued the chlor-alkali manufacturing processes until operations ceased in early 1994. Honeywell repurchased the property in 1998 and currently owns the property. Glynn County Planning Commission Land Use Maps show the area as property zoned industrial for both current and future use. Intended future land use for the property is continued commercial/industrial use.

3.2 Upland Removal Response Action: 1994-1997

Between 1994 and 1997, a removal response action was performed on the upland portion of the LCP Site. The removal action included the excavation of contaminated soils and industrial process waste. A total of approximately 167,000 cubic yards of soil and waste was removed for off-site disposal during these actions. The removal areas contained material contaminated with constituents including petroleum hydrocarbons (volatile and semi-volatile organic compounds), mercury, alkaline sludges, polychlorinated biphenyls (PCBs), and lead.

3.3 Summary of Environmental Investigations

Thousands of surface and/or subsurface soil samples have been collected in the upland area of the LCP site since 1994. The majority of these samples were collected between 1994 and 1999

[3] Based upon a 2008 property boundary survey by EMC Engineering Services, Inc.

during the assessment, removal, and post-excavation sampling phases of the upland removal/response action. The samples collected during this period consist of a variety of grab and composite samples, many of which were analyzed by one of two on-site laboratories (TEG and QAL).

Several supplementary soil investigations have been conducted in 2008, 2009, 2010, and 2011. These are described in the following bullets.

- 2008 upland soil sampling – Fifty surface soils samples were collected during the course of two sampling events during 2008. The first event was intended to provide supplemental data the baseline ecological risk assessment for OU3. Surface soil samples were collected from across the site and analyzed for PCBs, PAHs, lead, mercury, and methyl mercury. The other events were intended to provide additional characterization of Aroclors in soil in two areas of Quadrant 2.
- 2009 upland soil sampling – This sampling event was conducted to evaluate the potential leachability of constituents in upland soils. 30 samples were collected from 30 locations across the upland portions of the site. The depth interval of the samples varied somewhat, but most were within the 0 to 2 foot (ft) below ground surface (bgs) interval and all were within the top 5 ft bgs. The samples were analyzed for a comprehensive set of constituents.
- 2010 former drive in theater area sampling – This sampling event was conducted at the request of EPA to provide supplemental soil characterization in the former drive in theater area in the northeastern portion of the property (i.e., Quadrant 1). A total of 10 soil samples were collected from five locations to provide improved spatial coverage of the area when combined with locations of samples previously collected in this area. Soil samples were collected at two depths at each location, the first from 0 to 1 foot bgs, and the second from 2 to 3 ft bgs. The samples were analyzed for a comprehensive set of constituents. The results of this sampling event were summarized in a letter report to USEPA dated February 3, 2011 (EPS, 2011b).
- 2011 dioxin/furan sampling – This sampling event was conducted at the request of EPA to provide soil characterization for polychlorinated dibenzo-*p*-dioxin and polychlorinated dibenzo-*p*-furan congeners (dioxins/furans) for OU3. This sampling event used Incremental Sampling Methodology (ISM), which is consistent with recent USEPA draft guidance related to soils reassessment at dioxin sites (USEPA, 2010b). ISM is a structured composite sampling and processing protocol that is designed to reduce data variability and provides a robust estimate of the mean concentration of an analyte in the area/volume of soil being sampled. The concentrations of dioxins/furans in all of the ISM samples are below the current EPA soil cleanup levels for these constituents in residential and commercial/industrial soil (USEPA, 1998). However, the COPC screening was conducted using the more conservative interim draft recommended preliminary remediation goal value for dioxins/furans in residential soils (EPA 2009). The results of the COPC screening indicate that only one pair of replicate ISM samples collected in the southeast portion of the site (i.e., Quadrant 2) exceed these conservative

residential screening values. Further risk characterization of the ISM sample results for Quadrant 2 demonstrated that the cancer risk estimates and noncancer hazard estimates in that EU are below USEPA regulatory thresholds for these endpoints. Overall, the results dioxins/furans characterization indicates that these constituents do not represent a health concern for future commercial or industrial uses LCP site. The results of this sampling event were summarized in a report to USEPA dated July 2011 (EPS, 2011c).

4 RISK CHARACTERIZATION

4.1 Overview

The risk characterization presented in this section quantifies the magnitude of potential risks, based upon the post-removal action COPC concentrations remaining in the upland soils, under a broad range of land use and exposure considerations. The risk characterization begins with the selection of COPC specific to Exposure Units (EUs) or sub-portions of the site, consistent with the direction given by USEPA and EPD (USEPA, 2006a). This risk characterization also makes use of current toxicity values for COPC as provided in the USEPA December 2010 RSL Tables (USEPA, 2010). If a COPC was not listed on the RSL table, a surrogate chemical was provided from USEPA Region 4. The risk assessment follows the basic procedures outlined in USEPA Risk Assessment Guidance for Superfund: Volume I - Human Health Evaluation Manual (RAGS; USEPA 1989a).

4.2 Data Evaluation

4.2.1 Subdivision of the Property into Exposure Units

USEPA requested the main portion of the LCP property (about 110 contiguous acres of high ground) be segregated into four approximately equal-area EUs. Two physical boundaries were used to create the EUs: the north-south oriented fenceline that separates the primary operational areas to the west from administrative and light industrial operational areas to the east, and the east-west oriented "B Street" (an asphalt-paved site road maintained throughout all of the industrial uses of the site). This subdivision produces reasonably sized parcels with which to ascertain if sub-areas of the site may contain elevated concentrations of constituents relative to risks associated with potential future commercial/industrial use[4]. A fifth EU is created for the location of three off-site petroleum storage tanks (areas that are now privately owned and used for various commercial operations) and referred to herein as the off-site tank farm (OTF). Figure 2 shows the five EUs used in the HHBRA.

[4] The use of smaller exposure unit areas was evaluated and found to be prone to difficulties in calculation of statistically based exposure unit concentration owing to sparse sampling densities over some portions of the site. USEPA agreed (2006a) that a division of the site into four equal-area quadrants would provide for a useful representation of the exposure point concentration while accomplishing the objective of assessing risk on a multiple exposure unit basis.

4.2.2 Data Evaluation and Selection

Two data sets were considered quantitatively in the HHBRA. In one data set, the soil samples analyzed by an onsite laboratory (TEG) were excluded[5]. For the second data set, all data including records from TEG are used in the risk characterization. The results of the quantitative risk characterization using the second data set (including TEG laboratory data) are provided in Appendix A[6] and discussed in Section 4.9 (Uncertainty Analysis).

All data records were selected from the "master" site database applicable to the exposure scenario evaluated, with the exception of the following qualifiers outlined below:

- No records were extracted with an unknown coordinate position.
- Only samples identified as soil were extracted.
- Soil samples from the following site areas were excluded:
  - MH2O and MHO – former manholes that have since been cleaned and plugged-abandoned;
  - OFF – Off site sample locations except the tank farm area;
  - CRD – Canal Road Samples (these will be assessed with respect to risk-based cleanup goals in the Feasibility Study report); and
  - MSH – samples identified as marsh samples (will be evaluated in OU1).
- Soil samples from remediated (i.e. removed) portions of the site during the 1994-1997 Upland Removal Response Action were excluded.
- Soil samples from beneath the cap over the former cell building were excluded because there is no complete direct contact exposure pathway. Data from these samples will be evaluated in the OU2 remedial investigation.
- Duplicate records (e.g. blind sample duplicates) were excluded.
- Exclusion of select data records that exhibited anomalous detection limits. Review of data for the risk assessment identified a limited number of sample records with abnormally elevated detection limits. The excluded are listed in the table below:

Sample ID	COPC	Result	Detection Limit (mg/kg)
96213-16	Aroclor-1016	ND	418
96289-CPS-06	Aroclor-1016	ND	12
97104-01	Aroclor-1016	ND	27
LC-204-SLA	Aroclor-1016	ND	10
96213-16	Aroclor-1248	ND	418
96289-CPS-06	Aroclor-1248	ND	12

[5] The data records produced by the TEG laboratory were in support of the upland removal response action. Some of these data had anomalous results and were performed using sub-standard quality control (described in Appendix A). For this reason TEG was replaced by QAL labs for the remainder of the removal action. The remainder of the OU3 data records were generated by other off-site commercial laboratories.

[6] The Appendix A tables are numbered A14 through A23 to mirror the numbering convention of the risk calculation tables based on the "without TEG data set presented in the text.

97104-01	Aroclor-1248	ND	27
LC-204-SLA	Aroclor-1248	ND	10
96213-16	Aroclor-1254	ND	418

97104-01	Aroclor-1254	ND	27
LC-204-SLA	Aroclor-1254	ND	110
96213-16	Aroclor-1260	ND	418
96289-CPS-06	Aroclor-1260	ND	12
97104-01	Aroclor-1260	ND	27
96213-16	Aroclor-1268	ND	418
LC-642-WAB	Arsenic	ND	66
LC-201-SLA	Benzo(a)anthracene	ND	45
LC-202-SLB	Benzo(a)anthracene	ND	54
LC-201-SLA	Benzo(a)pyrene	ND	45
LC-202-SLB	Benzo(a)pyrene	ND	54
LC-201-SLA	Chrysene	ND	45
LC-202-SLB	Chrysene	ND	54
LC-201-SLA	Dibenzo(a,h)anthracene	ND	45
LC-202-SLB	Dibenzo(a,h)anthracene	ND	54
LC-201-SLA	Indeno(1,2,3-cd)pyrene	ND	45
LC-202-SLB	Indeno(1,2,3-cd)pyrene	ND	54

ND – Non detect

Additional details regarding these data exclusions are provided in Appendix B. The complete data sets (i.e., with and without TEG data) in Microsoft Excel format are on a CD-ROM provided in Appendix C.

4.2.3 Depth Selection Criteria for Exposure Scenarios

From the data sets constructed from the selection process outlined above, the soils data records were selected on the basis of sample depth as follows, where D1 is shallow extent of the soil sample and D2 is the deep extent of the soil sample:

Scenario	Applicable Depth	D1	D2
Commercial/Industrial Site Worker, Onsite Resident and Site Trespasser	Upper 2 ft	<1 ft	≤ 2 ft
Excavation Worker	Upper 5 ft	< 5 ft	≤ 6 ft

4.2.4 COPC Selection

In order to ensure that the HHBRA focuses on substances that contribute the greatest to the overall risk (USEPA, 1989a) the EU-specific OU3 soil data sets were subjected to a "screening" process to identify COPCs. Based on comments from USEPA and EPD on the COPC screening process applied in the previous version of this HHBRA report (EPS, 2010), a new data screening process was developed through extensive communication with USEPA and EPD representatives. Briefly this process entails:

1. elimination of constituents for which the maximum detected concentration in a particular EU did not exceed the applicable USEPA RSL for residential soil obtained from the December 2010 RSL Tables;
2. elimination of six inorganic constituents (calcium, chloride, magnesium, phosphorus, potassium, and sodium) because they are considered essential human nutrients (USEPA, 2000); and
3. elimination of constituents that were detected in fewer than 5% of the relevant samples, with the added provision that no more than 5% of the results for those constituents could have detection limits that exceed the applicable residential RSL.

In step 1 above, for carcinogenic compounds the residential RSLs associated with a 1×10^{-6} cancer risk were utilized for screening. For non-carcinogens, the residential RSLs adjusted to target hazard quotient of 0.1 was used for screening. Per USEPA Region 4 guidance (USEPA, 2000), this adjustment is to account for the potentially additive effects associated with the presence of multiple chemicals that may act on the same organ system. In addition, several constituents detected in site soils do not have USEPA-derived toxicity values and, therefore, no RSL values. For some of these constituents, "surrogate" RSLs were used in the COPC screening process based on a surrogate chemical list provided by USEPA Region 4. The letter containing this list of surrogate chemicals is provided in Appendix D. Tables 1A through 5A provided the results of this COPC screening process for each quadrant.

Constituents that that could not be eliminated in step 3 because of detection limits that exceed the applicable residential RSL in more than 5% of data records were given a "B" flag in Tables 1A through 5A, and were subjected to further screening refinements, including:

1. elimination of constituents with fewer than 5% of Level 4 (i.e., higher quality) data records with detection limits that exceed the relevant residential RSL;
2. elimination of constituents with fewer than 10% of Level 4 data records with detection limits that exceed the relevant USEPA contract required quantitation limits (CRQL);
3. elimination of constituents with no detections in samples from material that was excavated in the removal action; and 10 or more Level 4 data with detection limits below the relevant residential RSL; and
4. elimination of constituents for which there is no evidence of historical use at the site.

Tables 1B through 5B provided the results of COPC refinement process for each quadrant. Additional details about the COPC screening process are provided in Appendix E and the uncertainties associated with this refined screening approach are discussed in Section 4.9 (Uncertainty Analysis).

4.2.5 COPC Summary

The final list of COPCs selected for each exposure unit is presented below.

Off Site Tank Farm	Quadrant 1	Quadrant 2	Quadrant 3	Quadrant 4
Arsenic	Aroclor-1260	Aroclor-1221	1,1,2,2-Tetrachloroethane	1,2,4-Trimethylbenzene
Benzo(a)anthracene	Aroclor-1268	Aroclor-1254	1,2,4-Trimethylbenzene	1-Methyl Naphthalene
Benzo(a)pyrene	Arsenic	Aroclor-1260	1,4-Dichlorobenzene	Aluminum

Off Site Tank Farm	Quadrant 1	Quadrant 2	Quadrant 3	Quadrant 4
Benzo(b)fluoranthene	Benzo(a)anthracene	Aroclor-1268	1-Methyl Naphthalene	Antimony
Chromium	Benzo(a)pyrene	Arsenic	2-Methylnaphthalene	Aroclor-1254
Dibenzo(a,h)anthracene	Benzo(b)fluoranthene	Benzo(a)anthracene	4,6-Dinitro-2-methylphenol	Aroclor-1260
Lead	Benzo(b/k)fluoranthene [1]	Benzo(a)pyrene	Aluminum	Aroclor-1268
Mercury	bis(2-Ethylhexyl) phthalate	Benzo(b)fluoranthene	Antimony	Arsenic
	Chromium	Benzo(b/k)fluoranthene [1]	Aroclor-1016	Benzo(a)anthracene
	Dibenzo(a,h)anthracene	Carbazole	Aroclor-1254	Benzo(a)pyrene
	Indeno(1,2,3-cd)pyrene	Chromium	Aroclor-1260	Benzo(b)fluoranthene
	Iron	Dibenzo(a,h)anthracene	Aroclor-1268	Benzo(k)fluoranthene
	Lead	Indeno(1,2,3-cd)pyrene	Arsenic	Chloroform
	Mercury	Iron	Benzene	Chromium
	Vanadium	Mercury	Benzo(a)anthracene	Chrysene
			Benzo(a)pyrene	Cobalt
			Benzo(b)fluoranthene	Dibenzo(a,h)anthracene
			Benzo(k)fluoranthene	Indeno(1,2,3-cd)pyrene
			Bis(2-chloroethyl)ether	Iron
			Carbazole	Lead
			Chromium	Manganese
			Dibenzo(a,h)anthracene	Mercury
			Dibromochloromethane	Naphthalene
			Dichloromethane[2]	n-Butylbenzene
			Ethyl benzene	Tetrachloroethene
			Indeno(1,2,3-cd)pyrene	Vanadium
			Iron	Zinc
			Lead	
			Mercury	
			Naphthalene	
			n-Butylbenzene	
			n-Propylbenzene	
			Vanadium	

[1] Although benzo(b)fluoranthene and benzo(k)fluoranthene are distinct chemical constituents, historical samples in Quadrants 1 and 2 included analyses in which these two analytes were reported together (i.e., as benzo(b/k)fluoranthene). This constituent was included as a COPC in these two quadrants based on a comparison to the more conservative RSL value for benzo(b)fluoranthene. In these two quadrants, both benzo(b)fluoranthene and benzo(k)fluoranthene (as individual analytes) were eliminated as COPC based on comparisons with their respective RSL values.

[2] Methylene chloride

4.3 Exposure Assessment

4.3.1 Overview

The exposure assessment step in a risk assessment combines information about the chemical concentrations in site media with assumptions about how a potential receptor could contact the impacted media. The result is an estimation of a receptor's level of intake, or dose, of a chemical.

4.3.2 Identification of Potential Receptors

This risk assessment considers five exposure scenarios: (1) Commercial/Industrial Worker (current/future scenario), (2) Excavation Worker (future scenario), (3) Trespasser (current scenario), (4) Trespasser (future scenario); and (5) Hypothetical Resident (future scenario).

Glynn County Planning Commission Land Use Maps show the area as the property zoned as industrial property for both current and future use. Intended future land use for the property is commercial/industrial use. Under this intended land use, there are two types of non-residential receptor exposure scenarios: commercial/industrial workers (Industrial Workers scenario) and excavation/construction workers (Excavation Worker scenario).

Site workers presently perform site operations and maintenance, comprised of mowing of unimproved site access roads and the operation of a groundwater treatment system. These activities are generally limited to areas of the site which have already been remediated during the removal action (note: all current site O&M personnel are HAZWOPER trained and subscribe to annual medical monitoring and training, and are versed in the use of personal protective equipment for occasions which require potential exposure to COPC). Therefore, the assessment of the Industrial Worker scenario provided herein can be considered a conservative evaluation of the site workers presently performing the O&M activities described above.

Presently the site is fenced and gated and site access is controlled by the front office administrative staff. Night and weekend security patrol the grounds to control trespassing. As a conservative measure of evaluation, this HHBRA assumes standard exposure conditions in its evaluation of the Trespasser scenario.

Future use of the LCP site is anticipated to remain largely commercial/industrial, although some portions of the site may be amenable to less restrictive future land use. Honeywell has no intention of converting any portion of the property to residential use, and this restriction will be recorded (i.e., deed restriction) in the event the property or portions thereof are sold in the future. It is common practice with any HHBRA to evaluate a scenario involving residential reuse of the site. However, the hypothetical future Resident risk characterization is useful as a conservative surrogate for virtually any type of unrestricted land use and as such, the analysis may be useful to future land planning for various sub-portions of the property.

4.3.3 Potential Exposure Pathways (Conceptual Site Model)

4.3.3.1 Overview of Conceptual Site Model (CSM)

An exposure pathway is a description of the ways in which a person could be exposed to chemicals in the environment and is defined by four elements: (1) a source and mechanism of chemical release to the environment (for example, pesticide application); (2) an environmental transport medium (*e.g.*, soil, air) for the released chemical; (3) a point of potential contact with the contaminated medium (*e.g.*, surface soil accessible to direct human contact); and (4) an exposure route (*e.g.*, actual ingestion of contaminated soil and subsequent absorption from the gastrointestinal tract into the body). In order for an exposure pathway to be considered

complete, all four elements must occur. An illustrated CSM for this HHBRA is presented in Figure 3.

4.3.3.2 Industrial Worker CSM

Exposures by Industrial Workers to impacted media are limited to surficial soil routes. For the purposes of the risk assessment, workers were assumed to be exposed to surficial soil (defined here as 0 to 2 ft below ground surface (bgs)), in the absence of any specific work gear (such as coveralls, gloves, etc.) other than commonly worn clothing. The structural integrity of the majority of buildings remaining on the site is compromised such that demolition or extensive rehabilitation of these buildings would be required prior to their use. Additionally, air monitoring conducted during removal activities at the site indicated little to no emission of compounds during these activities (except when actual organic process waste material was being disturbed during removal). Therefore, the release of vapors from soils at the site is not expected to occur and vapor migration into buildings is not evaluated in this report. The current/future Industrial Worker scenario includes constituent exposure via incidental ingestion of and dermal contact with surface soil, and inhalation of particulates and vapors in air.

4.3.3.3 Excavation Worker CSM

In the event that any surface or subsurface excavations were to occur at the site, future Excavation Workers potentially could come in contact with constituents in a "mixed soil" interval consisting of both surficial and subsurface soil (defined here as 0 to 5 ft bgs). For the purposes of the risk assessment, Excavation Workers were assumed to be exposed to soil in the absence of any specialized protective equipment or clothing other than commonly worn protective clothing. The Excavation Worker scenario includes potential exposure to constituents via ingestion, dermal contact, and inhalation of particulates and vapors potentially released from the soil during excavation activities.

4.3.3.4 Trespasser CSM

The entrance to the LCP Site and property line along Ross Road are gated and fenced. The north and south property lines are also fenced. Security measures at the site currently include personnel to prevent unauthorized entrance to the site. Access to the site is further restricted by the adjacent marsh. The structures and vegetative growth on the surface of the site would limit the potential for exposure via ingestion, dermal contact, and inhalation. Nevertheless, the Trespasser scenario conservatively evaluates potential exposure to COPCs via ingestion of and dermal contact with surficial soil, and inhalation of particulates and vapors in air. At the direction of EPA, this revision of the HHBRA includes separate risk calculations for current and potential future trespassers. These scenarios differ only with respect to the assumptions about the frequency with which trespassers might access the property. Under the current scenario, access is assumed to be limited by the security measures described above. Under the future scenario, the exposure frequency is increased, (conservatively) reflecting the possibility that site access might not be controlled as tightly in the future.

4.3.3.5 Future On-Site Resident CSM

As described previously, Honeywell has no intention of converting any portion of the property to residential use, and this restriction will be recorded (i.e., deed restriction) in the event the property or portions thereof are sold in the future. Nevertheless, the Hypothetical Resident scenario conservatively evaluates potential exposure to COPCs via ingestion of and dermal contact with surficial soil, and inhalation of particulates and vapors in air. Potential inhalation exposure to vapors in indoor air was not included as a potential exposure route in this assessment. Pursuant to a request from the USEPA, a vapor intrusion screening assessment will be conducted with the Site groundwater data and presented in the HHBRA for the Groundwater Operable Unit (OU2).

4.3.4 Exposure Parameters

4.3.4.1 Overview of Exposure Parameters

Quantification of theoretical exposure of workers to COPCs in the on-site soil is a function of COPC concentrations and various exposure parameters that define both the conditions of exposure (*e.g.,* frequency of exposure, duration of exposure) and descriptors of potentially exposed receptors (*e.g.,* body weight, skin surface area). Exposure parameters refer to all of the variables used to calculate a daily human dose or intake level. The average daily dose (ADD) of each non-carcinogenic COPC is averaged over the estimated period of exposure (referred to as the averaging time) that varies for different types of receptors. The ADD is expressed in units of milligrams per kilogram per day (mg/kg-day). The daily dose of a potentially carcinogenic COPC is averaged over the lifetime of the exposed individual. The daily dose of each potentially carcinogenic COPC is referred to as the lifetime average daily dose (LADD) and also has units of mg/kg-d.

In accordance with USEPA guidance (1989), the exposure factors used in this risk assessment are intended to estimate both "reasonable maximum exposure" (RME) and "central tendency exposure" (CTE) for each receptor provide context to the range of possible hypothetical exposures at the site. RME is defined as "the maximum exposure that is reasonably expected to occur at a site" and USEPA has indicated that individual factors included in estimating exposure for an RME receptor should result in a final exposure estimate that approximates an upper percentile from a range of possible exposure estimates (EPA 1991). The exposure parameters utilized in the assessment are presented in Tables 6 through 9.

4.3.4.2 Industrial Worker Exposure Parameters

The exposure parameters utilized for the Industrial Worker are predominantly default worker exposure parameters from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002a) and Supplemental Guidance for Dermal Risk Assessment (USEPA, 2004). The values for these parameters are presented in Table 6A (RME) and Table 6B (CTE).

4.3.4.3 Excavation Worker Exposure Parameters

The exposure parameters utilized for the future site excavation worker are predominantly default excavation worker exposure parameters from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002a) and Supplemental Guidance for Dermal Risk Assessment (USEPA, 2004). Non-default parameters related to excavation work include exposure frequency and exposure duration (there are no default values for these parameters).

It is conservatively assumed that a typical excavation worker will work up to 260 days per year (5 days per week × 52 weeks per year). It is further assumed that an excavation worker will spend 6 months (0.5 years) conducting excavation related activities at the site (exposure duration of 0.5 years). It is conservatively assumed that an excavation worker will not utilize personal protective equipment (PPE) as a hazard mitigator in the course of their activity. Non-carcinogenic averaging time is by definition equal to the total number of days within the exposure duration. Subsequently, averaging time for the excavation worker becomes 0.5 years × 52 weeks per year × 7 days per week = 182 days. The values for these parameters are presented in Table 7A (RME) and Table 7B (CTE).

4.3.4.4 Current/Future Trespasser Exposure Parameters

The exposure parameters utilized for both the Current and Future Trespasser scenarios are predominantly values provided in the USEPA Region 4 Human Health Risk Assessment Bulletins (USEPA, 2000), Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002a) and Supplemental Guidance for Dermal Risk Assessment (USEPA, 2004), and the Exposure Factors Handbook (USEPA, 1997).

Access to the site is currently controlled by fencing, a gate, signage, and personnel. Following USEPA Region 4 guidance, the Trespasser scenario is based on an adolescent who might visit the property on an intermittent basis (USEPA, 2000). For the Current Trespasser scenario, exposure frequencies of 24 days/year and 6 days/year are assumed for the RME and CTE scenarios, respectively, consistent with earlier versions of the HHBRA. As directed by USEPA, a separate Future Trespasser scenario was included in this revision of the HHBRA to reflect the possibility that site access might not be controlled as tightly in the future. An exposure frequency of 52 days/year is assumed for the RME future scenario, which is consistent with the HHBRA for OU1 (EPS, 2011d). The CTE exposure frequency is the same between the current and future scenarios. The values for these parameters are presented in Table 8A (RME) and Table 8B (CTE).

4.3.4.5 Hypothetical Resident Exposure Parameters

The exposure parameters utilized for the Hypothetical Resident scenario are predominantly default exposure parameters from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, 2002a) and Supplemental Guidance for Dermal Risk Assessment (USEPA, 2004), and the Exposure Factors Handbook (USEPA, 1997). Separate values are provided for child and adult residents. The values for these parameters are presented in Table 9A (RME) and Table 9B (CTE).

4.3.5 Exposure Point Concentrations (EPCs)

A representative COPC-specific EPC is a COPC- and media-specific value that is incorporated into the exposure assessment equations from which potential human exposures are calculated. USEPA guidance (USEPA, 1992 2002) indicates that the COPC-specific RME EPC shall be the lesser of either the (i) the 95% upper confidence limit (UCL) on the arithmetic mean or (ii) the maximum detected concentration. The purpose for using the 95% UCL instead of the average concentration is to account for "the uncertainty associated with estimating the true average concentration at a site . . . [and] the 95% UCL provides reasonable confidence that the true site average will not be underestimated" (USEPA, 1992). These values are also used to evaluate the CTE exposure scenarios.

The USEPA's ProUCL software package (version 4.00.05) was used to statistically evaluate the "goodness of fit" of the data distribution for each of the EU data sets considering normal, lognormal, gamma, and non-parametric distribution approaches (including non detect data records). The ProUCL-recommended exposure point concentrations (EPCs) were developed from this analysis for each COPC in each EU, and these values are presented in Table 10 (surficial soils; 0-2 ft bgs) and Table 11 (mixed soils; 0-5 ft bgs).

Appendix F contains a CD-ROM with the "input" data files, in Microsoft Excel format, used in the ProUCL calculations and the ProUCL "output" files in Excel.

4.3.5.1 Direct Soil Contact

For direct contact exposures (i.e., incidental ingestion and dermal contact), the EPCs calculated by ProUCL were used as inputs to exposure equations 1 and 2.

4.3.5.2 Indirect Soil Contact

The calculation of inhalation intake requires the estimation of airborne concentrations of COPCs resulting from volatilization of organic COPCs as well as airborne dusts derived from soil. The EPCs calculated by ProUCL were used with the factors described below to estimate these airborne COPC concentrations for use in equation 3.

Ambient air concentrations resulting from volatilization of COPC in surface and subsurface soil were estimated using the USEPA volatilization factor (VF) approach (USEPA, 2002a). This approach combines information about the behavior of volatile COPCs in the soil with other soil property and atmospheric parameters to determine a volatilization factor for each volatile COPC. All VF values used in this assessment were obtained from the December 2010 RSL Tables (USEPA 2010a).

COPCs adsorbed to soil particles can potentially become airborne, resulting in possible inhalation by receptors. Long-term exposure to COPCs bound to dust particles was evaluated using the USEPA's default particulate emission factor (PEF) approach, which relates concentrations of a constituent in soil to the concentration of dust particles in the air (USEPA, 2002a). PEF values are not chemical-specific, but do vary by geographic location. The conservative default PEF value of 1.36E+9 was obtained from the December 2010 RSL Tables

(USEPA 2010a) and used in this assessment to estimate concentrations of COPCs in fugitive dust.

4.3.6 Quantification of Exposure

To quantify theoretical exposure of receptors to all COPCs, concentrations of each COPC are combined with the exposure parameters to estimate ADD[7] and LADD[8] for each receptor type. These dosages, which are expressed as milligrams per unit body weight per day (mg/kg-d), are averaged over a defined exposure period (*e.g.,* 25 years) for non-carcinogenic COPCs and over a lifetime (*i.e.,* 70 years) for carcinogenic COPCs. Standard equations are used for calculating ADDs and LADDs (USEPA, 1992a).

The standard equations for calculating the ADDs and LADDs for each exposure pathway have not changed since the 1999 HHBRA and are presented below.

4.3.6.1 Incidental Soil Ingestion

$$\text{ADD or LADD}_{ingestion}(mg/kg-d)=\frac{C_s \times IR_s \times EF \times ED \times CF}{BW \times AT \times 365d/yr} \quad \text{(EQ 1)}$$

where:

C_s = Constituent Concentration in Soil (mg/kg)
IR_s = Soil Ingestion Rate (mg soil/day)
CF = Conversion Factor (10^{-6} kg/mg)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
ABS_o = Oral Absorption Fraction (unitless)
BW = Body Weight (kg)
AT = Averaging Time (period over which exposure is averaged - years).

4.3.6.2 Dermal Contact with Soil

$$ADD\ or\ LADD_{dermal}(mg/kg-d)=\frac{C_s \times SA \times AF \times EF \times ED \times ABS_d \times CF}{BW \times AT \times 365d/yr} \quad \text{(EQ 2)}$$

where:

Cs = Constituent Concentration in Soil (mg/kg)
CF = Conversion Factor (10^{-6} kg/mg)
SA = Skin Surface Area Exposed (cm^2)
AF = Adherence Factor of Soil (mg/cm^2-event)
ABS_d = Dermal Skin Absorption Factor (unitless)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)

[7] ADDs are receptor- and COPC-specific dosages for assessing *non-carcinogenic* effects.
[8] LADDs are receptor- and COPC-specific dosages for assessing theoretical upper-bound *carcinogenic* risks.

BW = Body Weight (kg)
AT = Averaging Time (period over which exposure is averaged–years).

4.3.6.3 Inhalation

Inhalation exposure concentrations were calculated as follows:

$$\text{Air Concentration}_{inhalation}(mg/m^3) = \frac{C_a \times EF \times ED}{AT \times 365d/yr} \quad \text{(EQ 3)}$$

where:
Ca = Constituent Concentration in Air (mg/m^3) [calculated using Equation 3a below]
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
AT = Averaging Time (period over which exposure is averaged–years).

$$C_a\,(mg/m^3) = Cs \times \left(\frac{1}{PEF} + \frac{1}{VF}\right) \quad \text{(EQ 3a)}$$

where:
Ca = Constituent Concentration in Air (mg/m^3)
Cs = Constituent Concentration in Soil (mg/kg)
PEF = Particulate Emission Factor (m^3/kg) [all constituents, provided in Table 13]
VF = Volatilization Factor (m^3/kg) [volatile constituents only, provided in Table 13]

4.3.7 Lead Exposure

The quantification of lead exposure differs from other COPCs. Cause-and-effect relationships in humans have been correlated with blood concentrations of lead. Therefore, the preferred risk assessment approach for lead is the estimation of human blood lead concentrations associated with an exposure situation. Exposure of workers to lead and subsequent blood lead concentrations was estimated by use of the Adult Lead Model (ALM) developed by the USEPA Technical Work Group for Lead (USEPA, 2003). The Work Group recommended that adult lead exposure be evaluated by calculating a blood lead level in a pregnant adult, followed by calculating the resulting blood lead level in a fetus. The model put forth by the Work Group conservatively evaluates the upper end of the distribution of possible blood lead concentrations.

In modeling the blood lead level, the ALM considers a range of parameters. These include:

- The intake rate of lead from the site;
- The initial concentration of lead in the bloodstream of the adult prior to site exposure;
- The fraction of soluble lead that is absorbed into the gastrointestinal system;
- The relative bioavailability of lead in soil;

- A biokinetic slope factor that relates the increase in blood-lead levels to total intake;
- The geometric standard deviation among individual women of child-bearing age that could have exposures to similar on-site lead concentrations, but that have non-uniform responses (intake, biokinetics) to both on-site lead and off-site lead exposures; and
- The ratio between fetal and maternal lead concentrations in the bloodstream.

The following model was used to estimate blood lead levels in identified human receptors as a result of exposure to lead in soils:

$$PbB_{adult,\,central} = PbB_{worker,\,0} + \frac{PbS \times BKSF \times IR_S \times AF_S \times EF_S}{AT} \qquad \text{(EQ 4)}$$

where:

$PbB_{adult,\,central}$	=	Central estimate of blood lead concentration in adults that have site exposure (µg/dl)
$PbB_{worker,\,0}$	=	Typical blood lead concentration in adults in the absence of site exposure (µg/dl)
PbS	=	Arithmetic mean lead concentration in soil (µg/g)
BKSF	=	Biokinetic slope factor relating the increase in the adult blood lead level to the average daily lead uptake under quasi steady-state conditions (µg-lead/dl-blood per µg-lead/day)
IR_S	=	Soil ingestion rate (g/day)
AF_S	=	Absolute gastrointestinal absorption fraction for ingested lead from soil (unitless)
EF_S	=	Exposure frequency (days/year)
AT	=	Averaging time (days/year).

The following equation was used to estimate the 95th percentile blood lead concentration in a fetus from the average estimated adult blood lead concentration, assuming that blood lead levels are distributed lognormally:

$$PbB_{fetal,0.95} = PbB_{adult,central} \times GSD_{t,adult}^{1.645} \times R_{fetal,maternal} \qquad \text{(EQ 5)}$$

where:

$PbB_{fetal,\,0.95}$	=	95th percentile blood lead concentration among fetuses born to women exposed to site soil (µg/dl)
$PbB_{adult,\,central}$	=	Central estimate of blood lead concentration in adults that have site exposure (µg/dl)
$GSD_{t,adult}^{1.645}$	=	Estimated value of the individual geometric standard deviation (unitless). The exponent, 1.645, is the value of the standard normal deviate used to calculate the 95th percentile from a lognormal distribution.
$R_{fetal/maternal}$	=	Ratio between fetal blood lead concentration at birth to the maternal blood lead concentration (unitless).

The parameters utilized in the ALM model are presented in Table 12.

4.4 Toxicity Assessment

4.4.1 Overview

The risks associated with estimated exposures to the COPCs detected at the site are a function of the inherent toxicity of each constituent, as well as the estimated exposure dose.

Evaluation of the toxic potential of a constituent involves the examination of available data that relate observed toxic effects to known doses (i.e., dose-response assessment). Generally, there are two categories of information that are considered in this part of a quantitative risk assessment:

- Information on the potential acute or chronic non-cancer effects of constituents; and
- Information on the potential for constituents to initiate or promote cancers.

4.4.2 Non-Carcinogenic Health Effects

The assessment of non-carcinogenic effects is complex. There is a broad interaction of time scales (acute, sub-chronic, and chronic) and routes of exposure (ingestion, inhalation, dermal) with varying kinds of effects. A single constituent may elicit several adverse non-carcinogenic effects depending on the dose, exposure route, and duration of exposure. In addition, there are various levels of "severity" of effect.

For many non-carcinogenic effects, protective mechanisms must be overcome before the effect is manifested. Therefore, a finite dose (threshold) below which adverse effects will not occur is believed to exist for non-carcinogens. Many toxicological studies focus on identifying where this threshold occurs.

USEPA assumes there is a dose threshold below which adverse effects are not expected to occur. For a given constituent, the dose that elicits no effect when evaluating the most sensitive response (the adverse effect that occurs at the lowest dose) in the most sensitive species is used to establish an acceptable dose (toxicity value) for non-carcinogenic effects. This dose is referred to as the reference dose (RfD) for oral and dermal exposures, and a reference concentration (RfC) for inhalation exposures. A chronic RfD (or RfC) of a constituent is an estimate of a lifetime daily dose to humans that is likely to be without appreciable deleterious non-carcinogenic health effects. Exposure greater than an RfD could possibly cause health effects. A lower RfD implies a more potent toxicant.

The primary source of RfDs is USEPA's Integrated Risk Information System (IRIS), which is an electronic database for selected compounds that was established and maintained by USEPA. This database is based on a compendium of available toxicological data, containing both United States and international studies, and peer-reviewed and non-peer reviewed research. To derive an RfD, USEPA used professional judgment to assess the quality and relevance of the human or animal data and to identify the critical study and the most critical toxic effect. Data typically used by USEPA in developing the RfD are the highest no-observable-adverse-effect-levels (NOAELs) or lowest observed-adverse-effect level (LOAEL) for the critical studies and effects

of the non-carcinogen. An uncertainty factor is applied for each factor representing a specific area of uncertainty inherent in the extrapolation from the available data. Uncertainty factors are generally between 3 to 10. While a factor of 10 is commonly used, values less than 10 are sometimes used where data support the application of smaller uncertainty factors (USEPA 2006). Four major types of uncertainty factors are typically applied to NOAELs in the derivation of RfDs:

- 3- to10-fold factor for extrapolation from animals to humans;
- 3- to10-fold factor for variability in the human population;
- 3- to10-fold factor for use of a NOAEL based on a subchronic study instead of a chronic study; and
- 1- to 10-fold factor for extrapolation from a LOAEL to a NOAEL, if necessary.

Although on-going research is directed at the use of physiologically-based pharmacokinetic modeling to conduct interspecies extrapolation, at this time, no specific guidance is provided on the use of this method for developing better extrapolation (from animal to human, and administered versus absorbed) values for application.

In addition, a modifying factor can be used to account for adequacy of the database. Typically, the modifying factor is set equal to one. However, in certain instances, professional judgment can be applied to use the modifying factor to adjust the RfD (*e.g.*, epidemiological evidence). The IRIS database also provides a rating of confidence in the RfD, which refers to a qualitative judgment with regard to the quality of the critical study, the supporting database, and the dose developed.

4.4.3 Carcinogenic Effects

Cancer slope factors (CSFs, for oral and dermal exposures) and unit risk factors (URFs, for inhalation exposures) are constituent-specific, experimentally-derived potency values used to calculate the risk of cancer resulting from exposure to carcinogenic constituents. A higher value implies a more potent carcinogen. Studies of carcinogenicity typically focus on identification of the slope of the linear portion of a curve that relates dose *versus* tumorigenic response. A plausible upper-bound value of the slope is called the CSF (or URF). The product of a CSF and the exposure dose is an estimate of the risk of developing cancer. USEPA develops CSFs from chronic animal studies or, where possible, epidemiological data. Because animal studies use much higher doses over shorter periods of time than the exposures generally expected for humans, the data from these studies are adjusted, typically using a linearized multi-stage (LMS) mathematical model. To ensure protectiveness, CSFs are typically derived from the upper 95th percentile confidence limit of the slope, and thus the actual risks are unlikely to be higher than those predicted using the CSF, and may be considerably lower.

Historically, identification of constituents as known, probable, or possible human carcinogens was based on a USEPA weight-of-evidence classification scheme in which constituents were systematically evaluated for their ability to cause cancer in mammalian species, and conclusions

were reached about the potential to cause cancer in humans. The USEPA classification scheme (USEPA, 1989b) contained six classes based on the weight of available evidence, as follows:

- A - Known human carcinogen;
- B1 - Probable human carcinogen – limited evidence in humans;
- B2 - Probable human carcinogen – sufficient evidence in animals and inadequate data in humans;
- C - Possible human carcinogen – limited evidence in animals;
- D - Inadequate evidence to classify; and
- E - Evidence of non-carcinogenicity

USEPA does not develop CSFs for constituents in Classes D and E; therefore, in this risk assessment, carcinogenic risk evaluation was conducted for constituents in Classes A, B1, B2, and C.

4.4.4 Toxicity Values

4.4.4.1 Source of Toxicity Values

For this HHBRA, the USEPA December 2010 RSL Tables was the preferred source of toxicity values (EPA 2010a). The toxicity values used in this HHBRA are summarized in Table 13. The toxicity values used to develop RSLs follow the hierarchy of sources identified below:

1. IRIS;
2. Provisional Peer Reviewed Toxicity Values (PPRTVs) derived by EPA's Superfund Health Risk Technical Support Center;
3. The Agency for Toxic Substances and Disease Registry (ATSDR) minimal risk levels (MRLs);
4. California Environmental Protection Agency Chronic Reference Exposure Levels (RELS);
5. Screening toxicity values in an appendix to certain PPRTV assessments; and
6. Health Effects Summary Tables (HEAST).

4.4.4.2 Surrogate Toxicity Values

Several site COPC lack toxicity criteria from the sources listed above. USEPA Region 4 provided a surrogate chemical list that was applied to this HHBRA. The letter containing this list of surrogate chemicals is provided in Appendix D.

As described in Section 4.2.5, benzo(b/k)fluoranthene was retained as a COPC in Quadrants 1 and 2 based on a comparison to the more conservative RSL value for benzo(b)fluoranthene. Similarly, for the quantitative risk calculations for this COPC are based on the more conservative cancer slope factor for benzo(b)fluoranthene.

Surrogate toxicity values were also applied to Aroclors for this risk assessment. Specifically, the following extrapolations were applied: (i) the Aroclor 1254 slope factor is extrapolated to

Aroclor 1248, Aroclor 1260 and Aroclor 1268, (ii) the Aroclor 1254 reference dose was extrapolated to Aroclor 1248 and Aroclor 1260, and (iii) the Aroclor 1016 reference dose was extrapolated to Aroclor 1268. The uncertainty associated with these extrapolations, specifically, Aroclor 1254 toxicity values to Aroclor 1268 are presented in Section 4.9 (Uncertainty Analysis).

4.4.4.3 Derivation of Dermal Toxicity Values

Although USEPA has developed toxicity criteria for the oral and inhalation routes of exposure, it has not developed toxicity criteria for the dermal route of exposure. Based on USEPA guidance (2004), adjustment of oral toxicity criteria to derive dermal RfDs and CSFs was conducted as follows:

Dermal RfD = Oral RfD × Oral Absorption Efficiency; and
Dermal CSF = Oral SF/Oral Absorption Efficiency.

Values for oral absorption efficiency (i.e., GI absorption factors) were obtained from the December 2010 RSL Tables.

4.5 Risk Characterization

4.5.1 Overview

Risk characterization combines estimated exposure rates (*i.e.,* ADDs and LADDs) and toxicity criteria (*i.e.,* RfDs and CSF) resulting in estimates of theoretical upper-bound cancer risks and non-cancer hazards in hypothetical human receptors.

4.5.2 Methods for Assessing Cancer Risks

Theoretical upper-bound carcinogenic risk is estimated as the incremental probability of an individual developing cancer over a lifetime as a result of an exposure to a potentially carcinogenic COPC. Carcinogenic risks were evaluated by multiplying the estimated average exposure rate (*e.g.,* LADD calculated in the exposure assessment) by the COPC's CSF. The CSF converts estimated daily doses averaged over a lifetime to an incremental risk of an individual developing cancer. Because cancer risks are averaged over a person's lifetime, longer-term exposure to a carcinogen will result in higher risks than a shorter-term exposure to the same carcinogen, if all other exposure assumptions are constant. Theoretical risks associated with low levels of exposure in humans are assumed to be directly related to an observed cancer incidence in animals associated with high levels of exposure. According to USEPA (1989a), this approach is appropriate for theoretical upper-bound ELCR of less than 1×10^{-2}. The following equations were used to calculate COPC-specific risks and total risks:

$$Risk = LADD \times CSF \text{ (dermal contact and ingestion)} \quad \text{(EQ 6)}$$

$$Risk = LAC \times URF \text{ (inhalation)} \quad \text{(EQ 7)}$$

where:

LADD = lifetime average daily dose (mg/kg-d)
CSF = cancer slope factor $(mg/kg\text{-}d)^{-1}$
LAC = lifetime average concentration ($\mu g/m^3$)
URF = unit risk factor (risk per $\mu g/m^3$).

and

$Total\ Carcinogenic\ Risk = \Sigma\ Individual\ Risk$

It is assumed that cancer risks from various exposure routes are additive. Thus, the result of the assessment is a high-end estimate of the total carcinogenic risk. High-end carcinogenic risk estimates were compared to an acceptable risk range of 1 in 10,000 (10^{-4}) to 1 in 1 million (10^{-6}) or lower (USEPA, 1990).

4.5.3 Methods for Assessing Non-Cancer Health Effects

Non-cancer adverse health effects were estimated by comparing the estimated average exposure rate (*i.e.*, ADDs estimated in the exposure assessment) with an exposure level at which no adverse health effects are expected to occur for a long period of exposure (*i.e.*, the RfDs).

ADDs and RfDs were compared by dividing the ADD by the RfD to obtain the ADD:RfD ratio, as follows:

$$Hazard\ Quotient = ADD/RfD \quad \text{(EQ 8)}$$

$$Hazard\ Quotient = ADC/RfC \quad \text{(EQ 9)}$$

where:

ADD = average daily dose (mg/kg-day)
RfD = reference dose (mg/kg-day)
ADC = average daily concentration (mg/m^3)
RfC = reference concentration (mg/m^3).

Unlike carcinogenic risk estimates, a Hazard Quotient (HQ) is not expressed as a probability. If a person's average exposure is less than the RfD or RfC (*i.e.*, if the HQ is less than 1), the COPC is considered unlikely to pose a significant non-carcinogenic health hazard to individuals under the given exposure conditions. While both cancer and non-cancer risk characterizations indicate a relative potential for adverse effects to occur from exposure to a COPC, a non-cancer adverse health effect estimate is not directly comparable with a cancer risk estimate.

If more than one pathway is evaluated, the HQs for each pathway are summed to determine whether exposure to a combination of pathways poses a health concern. This sum of the HQs is known as a Hazard Index (HI):

Hazard Index = Σ Hazard Quotients.

Any HI at or below unity (1) indicates the exposure is unlikely to be associated with a potential health concern. USEPA suggests that if the HI exceeds unity, then target organ-specific HIs should be developed (USEPA, 2000). Note that this same USEPA Region 4 bulletin states HI values (as well as cancer risk values) are to be expressed as one significant figure.

It should be noted that not all COPCs act in a fashion that is additive; some COPC interactions may be antagonistic or have no interactive effect. In general, HQs are added for those COPCs that act similarly on the same target organs. If one COPC affects the kidney and a second COPC affects the lungs, these HQs are not summed. A target organ analysis has been performed where the HI (from all COPCs) exceeds 1, but no individual COPC has an HQ in excess of 1.

4.6 Risk Characterization

4.6.1 Industrial Worker Scenario

4.6.1.1 RME Risk Characterization

As shown in Tables 14A through 14E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.1, 0.4, 0.9 and 0.9 respectively, the calculated HI for the OTF area is 0.01. When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants1 through 4 are 0.1, 0.7, 1 and 1, respectively. Aroclor 1268 is not a COPC for the OTF area so there is only one computed HI value. All of these HIs are all less than or equal to the threshold level of 1 (unity).

As shown in Tables 14A through 14E, theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 3×10^{-6}, 1×10^{-5}, 1×10^{-5} and 3×10^{-5}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 6×10^{-6}. These theoretical upper-bound cancer risk estimates are within the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.1.2 CTE Risk Characterization

As shown in Tables 15A through 15E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HI for all COPCs at the property for Quadrants1 through 4 are 0.02, 0.07, 0.2, and 0.2, respectively, while the calculated HI for the OTF area is 0.002. When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HI for all COPCs at the property for Quadrants1 through 4 are 0.02, 0.1, 0.2, and 0.3, respectively. These HIs are all less than the threshold level of 1.

As shown in Tables 15A through 15E, theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 2×10^{-7}, 9×10^{-7}, 8×10^{-7} and 2×10^{-6}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 4×10^{-7}. These theoretical upper-bound cancer risk estimates are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.2 Excavation Worker Scenario

4.6.2.1 RME Risk Characterization

As shown in Tables 16A to 16E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.2, 0.8, 1 and 2, respectively, while the calculated HI for the OTF area is 0.03. When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.2, 1, 1 and 3, respectively. With the exception of Quadrant 4, these HIs are all less than or equal to the threshold level of 1. The HIs for Quadrant 4 exceed 1 by a small margin.

As shown in Tables 16A through 16E, theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 2×10^{-7}, 6×10^{-7}, 4×10^{-7} and 1×10^{-6}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 3×10^{-7}. These theoretical upper-bound cancer risk estimates are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.2.2 CTE Risk Characterization

As shown in Tables 17A to 17E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for quadrants 1 through 4 are 0.05, 0.2, 0.4 and 0.5, respectively, while the calculated HI for the OTF area is 0.009. When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.1, 0.4, 0.4 and 0.9, respectively. The HIs for all EUs are less than the threshold level of 1.

As shown in Tables 16A through 16E, theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 2×10^{-8}, 7×10^{-8}, $6 \times 10^{-7}$and 2×10^{-7}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 4×10^{-8}. These theoretical upper-bound cancer risk estimates are all below the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.3 Lead Risk Characterization for Nonresidential Exposures

Exposure of nonresidential workers to lead and subsequent blood lead concentrations are estimated by use of the ALM developed by the USEPA Technical Work Group for Lead (USEPA, 2003). The ALM model predicts an average soil lead concentration in excess of 1235 mg/kg is required to exceed a 5% probability that fetal blood level surpass a benchmark values determined to be protective of health (USEPA, 2009). The benchmark blood lead value is 10 micrograms lead per a deciliter of blood (µg/dL). In comparison, the IEUBK model for residential exposure predicted an average soil lead concentration of 400 mg/kg to be protective of health.

As shown below, all four quadrants and the OTF exhibited average **arithmetic mean** soil lead concentrations below the nonresidential soil concentration determined to be protective of human health based on a 10 µg/dL blood level (i.e., 1,235 mg/kg). The 95% UCL for the OTF exceeds

1235 mg/kg, but this is driven by a single detect of 3,155 mg/kg. The next highest value is 70 mg/kg.

Average and 95%UCL Soil lead Values for Site Exposure Units

	Mixed Soil (0 to 5 ft bgs)		Surface Soil (0 to 2 ft bgs)	
	Average (mg/kg)	**95%UCL (mg/kg)**	**Average (mg/kg)**	**95%UCL (mg/kg)**
OTF	159	413	280	2536
Quad 1	43	77	44	55
Quad 2	28	40	46	62
Quad 3	155	224	216	340
Quad 4	125	192	175	253

Note: Average and 95% UCL values calculated using ProUCL (Appendix F).

4.6.4 Current Trespasser Scenario

4.6.4.1 RME Risk Characterization

As shown in Tables 18A to 18E, The HI for the current trespasser for all EUs is less than unity. The highest calculated HI is for Quadrant 4 at 0.2. The theoretical upper-bound cancer risk estimates for all EUs are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.4.2 CTE Risk Characterization

As shown in Tables 19A to 19E, the HI for the current trespasser for all EUs is less than unity. The highest calculated HI is for Quadrant 4 at 0.03. The theoretical upper-bound cancer risk estimates for all EUs are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.5 Future Trespasser Scenario

4.6.5.1 RME Risk Characterization

As shown in Tables 20A to 20E, the HI for the current trespasser for all EUs is less than unity. The highest calculated HI is for Quadrant 4 at 0.4. The theoretical upper-bound cancer risk estimates for all EUs are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.5.2 CTE Risk Characterization

As shown in Tables 21A to 21E, the HI for the current trespasser for all EUs is less than unity. The highest calculated HI is for Quadrant 4 at 0.03. The theoretical upper-bound cancer risk estimates for all EUs are below or at the lower end of the USEPA acceptable risk range of 10^{-4} to 10^{-6}. Because the CTE exposure factors for the current and future trespasser are identical between the two scenarios, the theoretical cancer risk and noncancer hazards are the same.

4.6.6 Hypothetical Resident

Unlike the other receptors considered in the HHBRA, the Hypothetical Resident scenario includes separate intake calculations for two different age groupings, child and adult. Because the child receptor has a higher COPC intake and a lower body weight, and because the averaging time for non-carcinogen exposure is equivalent to the exposure duration (i.e., not averaged over a lifetime), the child will always have higher noncancer HQs/HIs than the adult. Therefore, the HI values presented in the following sections are for the child receptor only.

In contrast, intake estimates for carcinogens are averaged over a 70 year lifetime, and consistent with USEPA guidance (USEPA, 1989, 2000, 2002a), cancer risk estimates for residential receptors are time-weighted to incorporate exposure as a child and as an adult. In this HHBRA, the total cancer risk estimate for the adult was multiplied by 0.8 (i.e., 24 years/30years) and added to the total risk estimate for the child. This procedure provides a value for a residential "lifetime" exposure duration of 30 years with 6 years as a child, and 24 years as an adult.

4.6.6.1 RME Risk Characterization

As shown in Tables 22A to 22E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 1, 4, 9 and 10, respectively, while the calculated HI for the OTF area is 0.1. When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for quadrants 1 through 4 are 1, 7, 10 and 15,

respectively. The computed HIs indicate an unacceptable noncancer hazards to hypothetical future residents on Quadrants 2, 3 and 4. Quadrant 1 and the OTF area have HIs less than the threshold level of 1.

Theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 1×10^{-5}, 5×10^{-5}, 5×10^{-5} and 1×10^{-4}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 2×10^{-5}. These theoretical upper-bound cancer risk estimates are within the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.6.2 CTE Risk Characterization

As shown in Tables 23A to 23E, when the less conservative RfD for Aroclor 1016 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.7, 2, 5 and 5, respectively, while the calculated HI for the OTF area is 0.06 When the more conservative RfD for Aroclor 1254 is used in the HQ calculation for Aroclor 1268, the summed HIs for all COPCs at the property for Quadrants 1 through 4 are 0.8, 4, 6 and 8, respectively. The computed HIs indicate an unacceptable noncancer hazards to hypothetical future residents on Quadrants 2, 3 and 4. Quadrant 1 and the OTF area have HIs less than the threshold level of 1.

Theoretical upper-bound cancer risk estimates for COPCs in soils for Quadrants 1 through 4 are 3×10^{-6}, 9×10^{-6}, 8×10^{-6} and 2×10^{-5}, respectively. The off-site tank farm theoretical upper-bound cancer risk estimate is 4×10^{-6}. These theoretical upper-bound cancer risk estimates are all within the USEPA acceptable risk range of 10^{-4} to 10^{-6}.

4.6.7 Lead Risk Characterization for Residential Exposure

Potential exposure to lead was evaluated using USEPA's IEUBK model to assume that resident children aged 0 to 6 years could contact lead in soil. The USEPA recommends a benchmark of either 95% of the sensitive population of children having blood lead levels below 10 micrograms per deciliter (µg/dL) or a 95% probability of an individual child having a blood lead level below 10 µg/dL. Based on this requirement, exposure units should exhibit an average soil concentration of less than 400 mg/kg. All quadrants and the off-site tank farm exhibit an arithmetic mean soil lead concentration below 400 mg/kg.

4.7 Identification of Risk Drivers

4.7.1.1 Overview

The percentage of the total HI and ELCR contributed by primary COPC groups (e.g., Aroclors, PAHs and mercury) is summarized below for the RME exposure scenario. The principal drivers of site hazard are Aroclors[9] and mercury; the principal drivers of site risk are Aroclors and

[9] 4,6-dinitro-2-methylphenol was also a significant contributor to HI estimates in Quadrant 3 for the surface soil receptors, contributing from 37% to 61% of the total HI depending on the receptor scenario. These HI estimates are extremely conservative based on the fact that this constituent was only detected in one of 21 samples, and that single

PAHs. The contribution estimates for Aroclors are based on the more conservative evaluation of Aroclor 1268 using the RfD for Aroclor 1254.

4.7.1.2 Industrial Worker Risk Drivers

The percentage of the total HI and ELCR contributed by primary COPC groups (e.g., Aroclors, PAHs and mercury) is summarized below for the RME exposure scenario. The principal drivers of site hazard are Aroclors and mercury; the principal drivers of site risk are Aroclors and PAHs.

Principal Risk Drivers for Industrial Worker Assessment

	Aroclors*		PAHs		Mercury	
	%HI	%ELCR	%HI	%ELCR	%HI	%ELCR
Quadrant 1	35	11	0	33	45	0
Quadrant 2	94	68	0	16	4	0
Quadrant 3**	26	31	1	15	1	0
Quadrant 4	94	67	0	20	2	0
OTF	0	0	0	69	16	0

** 4,6-dinitro-2-methylphenol contributed 61% of the HI for the Industrial Worker at Quadrant 3.

4.7.1.3 Excavation Worker Hazard Risk Drivers

The percentage of the total HI and ELCR contributed by primary COPC groups, Aroclors, PAHs and mercury, is summarized below for the RME exposure scenario. The principal drivers of site hazard are Aroclors and mercury; the principal drivers of site risk are Aroclors and PAHs.

Principal Risk Drivers for Excavation Worker Assessment

	Aroclors		PAHs		Mercury	
	%HI	%ELCR	%HI	%ELCR	%HI	%ELCR
Quadrant 1	39	10	0	29	35	0
Quadrant 2	94	61	0	19	3	0
Quadrant 3**	40	33	1	21	3	0
Quadrant 4	90	61	<1	35	7	0
OTF	0	0	0	57	19	0

** 4,6-dinitro-2-methylphenol contributed 37% of the HI for the Excavation Worker at Quadrant 3.

4.7.1.4 Current/Future Trespasser Risk Drivers

The percentage of the total HI and ELCR contributed by primary COPC groups (e.g. Aroclors, PAHs and mercury, is summarized below for the RME exposure scenario. The principal drivers of site hazard are Aroclors and mercury; the principal drivers of site risk are Aroclors and PAHs.

detected concentration (32 mg/kg) was used as the EPC because ProUCL does not generate UCL estimates for data sets consisting of so many non-detects. The highest detection limit value was 3.65 mg/kg.

Principal Risk Drivers for Trespasser Assessment

	Aroclors		PAHs		Mercury	
	%HI	%ELCR	%HI	%ELCR	%HI	%ELCR
Quadrant 1	49	14	0	40	37	0
Quadrant 2	96	72	0	17	2	0
Quadrant 3**	28	37	<1	17	1	0
Quadrant 4	96	71	<1	21	1	0
OTF	0	0	0	76	14	0

** 4,6-dinitro-2-methylphenol contributed 62% of the HI for the Current/Future Trespasser at Quadrant 3.

4.7.1.5 Hypothetical Resident Risk Drivers

The percentage of the total HI and ELCR contributed by primary COPC groups e.g., Aroclors, PAHs and mercury) is summarized below for the RME exposure scenario. The principal drivers of site hazard are Aroclors and mercury; the principal drivers of site risk are Aroclors and PAHs.

Principal Risk Drivers for Hypothetical Resident Assessment

	Aroclors		PAHs		Mercury	
	%HI	%ELCR	%HI	%ELCR	%HI	%ELCR
Quadrant 1	25	10	0	29	50	0
Quadrant 2	91	65	0	15	6	0
Quadrant 3**	25	27	<1	13	2	0
Quadrant 4	92	64	<1	19	2	0
OTF	0	0	0	58	17	0

** 4,6-dinitro-2-methylphenol contributed 63% of the HI for the Hypothetical Resident at Quadrant 3.

4.8 Remedial Goal Options

4.8.1 Overview

Health risk-based soil concentrations have been developed from the risk characterization model setup for each receptor for non-cancer effects and cancer endpoints for each of these COPCs. These concentrations may be utilized as remedial goal options (RGOs) for the Feasibility Study in evaluating whether clusters of sample locations exceeding the RGO (USEPA often uses the term "hot spots" to describe this circumstance) warrant consideration for remedial action, even though the cancer risk and non-cancer hazard for that EU is within acceptable range. Consistent with USEPA Region 4 guidance (2002), RGOs were calculated for each COPC identified as a COC. This guidance states:

> *Chemicals of Concern (COCs) are the Chemicals of Potential Concern (COPCs) that significantly contribute to a pathway in a use scenario for a receptor (e.g. hypothetical future*

child resident, current youth trespasser, current adult construction worker, etc.) that either (a) exceeds a 10-4 cumulative site cancer risk; or (b) exceeds a non-carcinogenic hazard index (HI) of 1. Note: generally, a 10-4 cumulative site risk level and an HI of 1 are used as the remediation "trigger." The exact level used as the "trigger" is at the discretion of the risk manager. The carcinogen "trigger" represents the summed risks to a receptor considering all pathways, media, and routes per land use scenario. The HI represents the total of the hazard quotients (HQs) of all COPCs in all pathways, media, and routes to which the receptor is exposed. If the HI exceeds 1.0, then more specific HIs should be developed by summing HQs of COPCs with Reference Doses (RfDs) based on toxic effects on the same target organs. This specific target-organ based HI should form the basis of COC selection. Chemicals are not considered as significant contributors to risk and therefore are not included as COCs if their individual carcinogenic risk contribution is less than 10-6 and their non-carcinogenic HQ is less than 0.1.

Consistent with USEPA guidance, the RBCs are calculated based on a progression of hazard indices and cancer risks (i.e., HIs of 0.1, 1.0, and 3.0, and a theoretical upper-bound ELCRs of 1×10^{-6}, 1×10^{-5}, and 1×10^{-4}) for individual chemicals. To calculate RGOs, a simple proportion calculation can be performed:

$$\text{RGO} = \frac{\text{EPC}_{\text{COPCx}} \times \text{Target HQ/ELCR}_{\text{COPCx}}}{\text{Computed HQ/ELCR}_{\text{COPCx}}} \qquad \text{(EQ 10)}$$

Receptor risk estimate summaries are provided in Tables 24, 26, and 26. Examination these tables indicates that the Industrial Worker and Hypothetical Resident are the only receptors for which cancer risk estimates trigger development of RGOs on one or more of the EUs. The noncancer hazard estimates for the Industrial Worker, Excavation Worker, and Hypothetical Resident scenarios trigger the development of RGOs in one or more of the EUs. The calculated RGOs for these scenarios are provided in Table 27.

4.9 Uncertainty Analysis

4.9.1 Overview

All risk estimates have some degree of uncertainty due to the uncertainty and variability in the exposure and toxicity value used to estimate risk. These uncertainties, which arise at every step of a risk assessment, are evaluated to provide an indication of the relative degree of overall uncertainty associated with a risk estimate. In this section, a qualitative discussion of the uncertainties associated with the risk assessment for the site is presented. Table 28 provides a summary of the qualitative evaluation of uncertainty applicable to the receptor scenarios considered.

Risk assessments are not intended to estimate actual risks to a receptor associated with exposure to chemicals in the environment. In fact, estimating actual risks is impossible because of the variability in the exposed or potentially exposed populations. Therefore, risk assessment is a means of estimating the probability that an adverse health effect (*e.g.*, cancer, impaired

reproduction) will occur in a receptor. The multitude of conservative assumptions used in risk assessments guard against underestimation of risks.

Risk estimates are calculated by combining site data, assumptions about individual receptor's exposures to impacted media, and toxicity data. The uncertainties in this risk assessment can be grouped into three main categories that correspond to these steps:

- Uncertainties in environmental sampling and analysis;
- Uncertainties in assumptions concerning exposure scenarios;
- Uncertainties in toxicity data; and
- Uncertainties due to background or ubiquitous constituents.

4.9.2 Environmental Sampling and Analysis

This risk assessment is based on the sampling results obtained from the previous investigations at the property. Errors and variability in sampling results can arise from the field sampling, laboratory analyses, and data analyses. Differences in laboratories, analysis procedures and quality of results are variables for this project (*e.g.*, the data set utilizes results of both onsite/mobile laboratory testing and off-site/commercial laboratory testing, although the impacts of these sorts of errors on the risk estimates are likely to be low).

The environmental sampling at a site is one source of uncertainty in the evaluation. However, the number of sampling locations and events is large; and USEPA has concurred that the investigational program is sufficient to support decision making at the property. Therefore, the sampling and analysis data is deemed sufficient to characterize the impacts and the associated potential risks.

4.9.3 Uncertainties in the COPC Screening Process

Constituents were selected as COPCs based on comparisons between the maximum detected concentration and conservative risk-based screening criteria (i.e., USEPA residential RSLs). A number of detected constituents did not have an RSL. USEPA Region 4 provided toxicological "surrogates" for some of these constituents (Appendix D), and the RSLs for these surrogates were used in the screening process.

There were also a number of constituents with no or limited detected results, but for which more than 5% of the data records have analytical detection limits that exceed the relevant RSL values. These constituents were subjected to a refined screening approach in which the detection limits in Level 4 (i.e., higher quality) data records were compared to the USEPA RSLs and CRQLs. Additional factors such as the presence of the constituent in samples of material excavated in the removal response action and information about historical use of the constituent at the site were also considered for these constituents.

The remaining constituents that could not be completely eliminated as COPC based on this refined screening process were identified as "Qualitative COPC" in Tables 1A through 5A. A complete list of these constituents is provided below:

Off Site Tank Farm	Quadrant 1	Quadrant 2	Quadrant 3	Quadrant 4
Aroclor-1016	4,6-Dinitrophenol	No Qualitative COPC	1,1-Dichloropropene	No Qualitative COPC
Aroclor-1221	Bis(2-Chloroethyl) ether			
Aroclor-1232	Hexachlorobenzene			
Aroclor-1242	N-Nitroso-di-n-propylamine			
Aroclor-1248	Pyridine			
Aroclor-1254				
Aroclor-1260				
Aroclor-1268				

A factor that significantly influences the identification of these COPC is the application of the refined screening criteria on quadrant-specific basis. If the same set of refined screening criteria were applied to the site-wide OU3 dataset, all of these constituents would be eliminated as COPC because there are a sufficient number of Level 4 data results on a site-wide basis to conclude that these constituents are not present at concentrations that represent a potential human health concern. Further, for these constituents the majority of sample results with data quality issues (i.e., detection limits that exceed CRQLs) were generated by USEPA's Environmental Sciences Division (ESD) laboratory which analyzed a large number of samples during the removal response action.

The use of this conservative screening process in the HHBRA provides a high degree of certainty that the quantitative risk assessment focused on COPCs that had the highest contribution to potential risks. As shown in Section 4.7, even though many COPCs were identified in each of the quadrants, Aroclors, PAHs, and mercury were the primary risk drivers in most of the quadrants. Potential uncertainty associated with the exclusion of constituents is also minimized by the use of highly conservative screening criteria.

4.9.4 Uncertainties in Exposure Assumptions

In this risk assessment, the exposure assessment is based on a number of assumptions with varying degrees of uncertainty. Uncertainties can arise from the types of exposures examined, the points of potential human exposure, the concentrations of COPCs at the points of human exposure, and the intake assumptions. The selection of exposure pathways is a process, often based on best professional judgment that attempts to identify the most probable potentially harmful exposure scenarios. While exposure pathways other than the ones quantified in this HHBRA could exist for a future land use, these exposures are expected to be much lower than the risks associated with the pathways considered in this risk assessment.

The risks calculated depend largely on the assumptions used to calculate the rate of COPC intake. For this assessment, reasonable maximum exposures were used. In the absence of a value for a particular exposure parameter, professional judgment based on site conditions was

used. The uncertainties associated with the parameters used in this risk assessment are described below.

Individuals can come into contact with chemicals via a number of different exposure routes. For the reasonable maximum exposure scenarios, standard default rates were used for these exposures. These represent upper-bound values and provide reasonable maximum activity assumptions. The use of these standard default and upper-end values makes it likely that the risk is not underestimated, and may in fact be overestimated.

4.9.5 Uncertainties in Aroclor 1268 Toxicity Data

The IRIS database does not contain an oral cancer slope factor or an oral reference dose specific to Aroclor 1268. Therefore, as a conservative measure, the EPA and EPD required the use of Aroclor 1254 toxicity values (the most toxic form of Aroclor) as a surrogate for Aroclor 1268 in the HHBRA. This conservative measure can reasonably be acknowledged to overestimate the risk imposed by Aroclor 1268 based on recent toxicology studies available in the scientific peer-reviewed literature.

It is understood that the Aroclor 1268 toxicity values from the peer-reviewed literature have not been evaluated by USEPA's IRIS assessment review and are not established Provisional Peer Reviewed Toxicity Values. However, the consensus of the studies is that Aroclor 1268 represents the least toxic scenario and harm of the Aroclors evaluated, which are lower than the values available for either Aroclor 1016 or Aroclor 1254. An analysis of Aroclor 1268 toxicity from the peer-reviewed literature was completed and is presented as an element of uncertainty in the modeling process in Appendix G.

4.9.6 Uncertainties Due to Background or Ubiquitous Constituents

Review of the February 2007 OU3 HHBRA indicated some quadrant risk characterizations were artificially elevated due to soil PAHs which are at concentrations equivalent to the regional condition across the Brunswick peninsula. Consequently, a review of the screening process for soil PAH data was completed to account for background levels, as shown in Appendix H. The review included data at the national scale, from the regional scale and from peer-reviewed literature applicable to coastal soils for the following PAHs: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(c,d-123)pyrene.

It is also important to note that the data from all quadrants at the LCP site are dominated by non-detects for PAHs. The inclusion of PAHs in the HHBRA followed standard EPA procedures for non-detects by applying as a surrogate result value of one-half the detection limit. This point is discussed in further detail in Appendix H.

In summary, for all PAHs and in all quadrants, the median value of the background sample developed from literature specific to the Southeast United States was greater than the median value of that individual PAH on the LCP site. In some cases, the mean values in some of the quadrants were higher than the corresponding background mean. In these cases, the difference

between the two sets values was assessed with the Wilcoxon Rank Sum test. In all cases in which the quadrant mean was greater than the background mean, the Wilcoxon Rank Sum Test did not show a significant difference between the two data sets. The overall conclusion is that the PAHs that are present at the site are at or below levels consistent with general anthropogenic background for the southeast Atlantic coast. This analysis was complicated by the large number of non-detects in the site sample; however, this number of non-detects suggests on a qualitative basis that site-related concentrations of carcinogenic PAHs are relatively low.

The results of PAH background evaluation suggest the inclusion of PAHs in the HHBRA would include non-site related contributions to the cumulative risk assessment. Therefore, quadrant risk elevated in part by PAHs should be considered as a potential point of uncertainty.

4.9.7 Uncertainties Due to Exclusion of TEG Data Records

As discussed in Section 4.2.2 and in Appendix A, all data generated the TEG onsite laboratory were excluded from the quantitative risk characterization provided in the body of this report. The TEG laboratory was used for a period of time to support the upland removal response action, but was eventually replaced by another onsite laboratory (QAL) because of unsatisfactory quality control. As directed by USEPA, a separate quantitative risk characterization was conducted based on the OU3 data set including data from the TEG laboratory.

The detailed risk calculation tables associated with this separate analysis are provided in Appendix A. In addition, Tables 10 and 11 provide side-by-side comparisons of the EPCs generated using both data sets and Tables 24 through 26 provide summaries of the theoretical cancer risk and noncancer hazard by quadrant for both data sets. As shown in Tables 6 and 7, the EPCs for most of the COPCs are not significantly different between the two data sets. The inclusion of the TEG data is generally most significant for the Aroclors, for which the EPCs are higher when the TEG data are included. As shown in Tables 24 through 27, when the data sets that include the TEG data are used, the cancer risk and hazard estimates increase by a maximum of about 2 times in Quad 2. The differences in the other EUs are less significant. Overall, these results demonstrate that the exclusion of the TEG data had a minimal effect on the analysis or the conclusions drawn from it.

Notes:
(1) Values are November 2010 Residential RSLs (except for thallium).
(2) RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) RSL for thallium taken from May 2009 RSL Table.
Thallium RfD subsequently withdrawn from IRIS.

Highlighted Cells Key:
Frequency Detection < 5%
Constituent without RSL - Surrogate Chemical Identified

COPC screening code :

A	Low record count <10 site wide
B	DLs above adjusted residential RSL
C	Less than 5% detection frequency including DLs above adjusted RSL
D	Parameter with N flag
E	Essential nutrient
F	Less than 5% detection frequency and no RSL
G	Max detect and max DL below adjusted residential RSL
T	Thallium was dropped from COPC list because it was not used historically at the site, has a low number of actual detects, and the RSL value was withdrawn by EPA
Y	Retain as COPC

Table 1B
COPC Screening Refinements for "B" Flagged Parameters - OTF

Parameter	CRQL Medium[1] (mg/kg)	Residential RSL [2] (mg/kg)	# of Records	# DL above CRQL	% DL above CRQL [3]	# DL above RSL	% DL above RSL [4]	# Level 4 data records	# Level 4 data DL below RSL [5]	# Excavated Sample Records	# Detects in Excavated Samples	Comments

Aroclor-1268	0.033	0.22	27	27	100	24	89	3	3	0	0	Retain as Qualitative COPC
bis(2-Chloroethyl) ether	5	0.21	3	0	0	3	100					Drop - <10% DL > CRQL
Indeno(1,2,3-cd)pyrene	5	0.15	27	0	0	27	100					Drop - <10% DL > CRQL
N-Nitroso-di-n-propylamine	5	0.069	3	0	0	3	100					Drop - <10% DL > CRQL
Pentachlorophenol	10	0.89	3	0	0	1	33					Drop - <10% DL > CRQL
Thallium [6]	2.5	0.51	3	0	0	3	100					Drop - <10% DL > CRQL

Notes:

(1) Values are the EPA Contract Laboratory Program "Medium Soil" Contract Required Quantitation Limits (CRQL).

(2) Values are November 2010 Residential RSLs; RSLs for non-carcinogens were adjusted to a HQ of 0.1.

(3) Red text indentifies constituents with 10% or less of the detection limits (DLs) exceeding the relevant Medium Soil CRQLs.

(4) Blue text identifies constituents with 5% or less of the DLs exceeding residential RSLs.

(5) Green text identifies constituents with more than 10 Level 4 data records with DLs below the residential RSL.

(6) RSL for thallium taken from May 2009 RSL Table; the RfD was subsequently withdrawn from IRIS.

Notes:
(1) Values are November 2010 Residential RSLs (except for thallium).
(2) RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) RSL for thallium taken from May 2009 RSL Table.
Thallium RfD subsequently withdrawn from IRIS.

Highlighted Cells Key:
Frequency Detection < 5%
Constituent without RSL - Surrogate Chemical Identified

COPC screening code (from HHBRA):
A Low record count <10 site wide
B DLs above adjusted residential RSL
C Less than 5% detection frequency including DLs above adjusted RSL
D Parameter with N flag
E Essential nutrient
F Less than 5% detection frequency and no RSL
G Max detect and max DL below adjusted residential RSL
T Thallium was dropped from COPC list because it was not used historically at the site, has a low number of actual detects, and the RSL value was withdrawn by EPA
Y Retain as COPC

Thallium [6]	2.5	0.51	40	5	13	27	68	40	14			Drop - not used at site

Notes:

(1) Values are the current EPA Contract Laboratory Program "Medium Soil" Contract Required Quantitation Limits (CRQL).

(2) Values are November 2010 Residential RSLs; RSLs for non-carcinogens were adjusted to a HQ of 0.1.

(3) Red text indentifies constituents with 10% or less of the detection limits (DLs) exceeding the relevant Medium Soil CRQLs.

(4) Blue text identifies constituents with 5% or less of the DLs exceeding residential RSLs.

(5) Green text identifies constituents with more than 10 Level 4 data records with DLs below the residential RSL.

(6) RSL for thallium taken from May 2009 RSL Table; the RfD was subsequently withdrawn from IRIS.

Notes:
(1) Values are November 2010 Residential RSLs (except for thallium).
(2) RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) RSL for thallium taken from May 2009 RSL Table.
Thallium RfD subsequently withdrawn from IRIS.

Highlighted Cells Key:
Frequency Detection < 5%
Constituent without RSL - Surrogate Chemical Identified

COPC screening code (from HHBRA):
A Low record count <10 site wide
B DLs above adjusted residential RSL
C Less than 5% detection frequency including DLs above adjusted RSL
D Parameter with N flag
E Essential nutrient
F Less than 5% detection frequency and no RSL
G Max detect and max DL below adjusted residential RSL
T Thallium was dropped from COPC list because it was not used historically at the site, has a low number of actual detects, and the RSL value was withdrawn by EPA
Y Retain as COPC

Notes:

(1) Values are the current EPA Contract Laboratory Program "Medium Soil" Contract Required Quantitation Limits (CRQL).

(2) Values are November 2010 Residential RSLs; RSLs for non-carcinogens were adjusted to a HQ of 0.1.

(3) Red text indentifies constituents with 10% or less of the detection limits (DLs) exceeding the relevant Medium Soil CRQLs.

(4) Blue text identifies constituents with 5% or less of the DLs exceeding residential RSLs.

(5) Green text identifies constituents with more than 10 Level 4 data records with DLs below the residential RSL.

(6) RSL for thallium taken from May 2009 RSL Table; the RfD was subsequently withdrawn from IRIS.

Notes:
(1) Values are November 2010 Residential RSLs (except for thallium).
(2) RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) RSL for thallium taken from May 2009 RSL Table.
Thallium RfD subsequently withdrawn from IRIS.

Highlighted Cells Key:
Frequency Detection < 5%
Constituent without RSL - Surrogate Chemical Identified

COPC screening code (from HHBRA):
A Low record count <10 site wide
B DLs above adjusted residential RSL
C Less than 5% detection frequency including DLs above adjusted RSL
D Parameter with N flag
E Essential nutrient
F Less than 5% detection frequency and no RSL
G Max detect and max DL below adjusted residential RSL
T Thallium was dropped from COPC list because it was not used historically at the site, has a low number of actual detects, and the RSL value was withdrawn by EPA
Y Retain as COPC

Notes:
(1) Values are the current EPA Contract Laboratory Program "Medium Soil" Contract Required Quantitation Limits (CRQL).
(2) Values are November 2010 Residential RSLs; RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) Red text indentifies constituents with 10% or less of the detection limits (DLs) exceeding the relevant Medium Soil CRQLs.
(4) Blue text identifies constituents with 5% or less of the DLs exceeding residential RSLs.
(5) Green text identifies constituents with more than 10 Level 4 data records with DLs below the residential RSL.
(6) RSL for thallium taken from May 2009 RSL Table; the RfD was subsequently withdrawn from IRIS.

Notes:
(1) Values are November 2010 Residential RSLs (except for thallium).
(2) RSLs for non-carcinogens were adjusted to a HQ of 0.1.
(3) RSL for thallium taken from May 2009 RSL Table.
Thallium RfD subsequently withdrawn from IRIS.

Highlighted Cells Key:
Frequency Detection < 5%
Constituent without RSL - Surrogate Chemical Identified

COPC screening code:
A Low record count <10 site wide
B DLs above adjusted residential RSL
C Less than 5% detection frequency including DLs above adjusted RSL
D Parameter with N flag
E Essential nutrient
F Less than 5% detection frequency and no RSL
G Max detect and max DL below adjusted residential RSL
T Thallium was dropped from COPC list because it was not used historically at the site, has a low number of actual detects, and the RSL value was withdrawn by EPA
Y Retain as COPC

Notes:

(1) Values are the current EPA Contract Laboratory Program "Medium Soil" Contract Required Quantitation Limits (CRQL

(2) Values are November 2010 Residential RSLs; RSLs for non-carcinogens were adjusted to a HQ of 0.1

(3) Red text indentifies constituents with 10% or less of the detection limits (DLs) exceeding the relevant Medium Soil CRQL

(4) Blue text identifies constituents with 5% or less of the DLs exceeding residential RSL

(5) Green text identifies constituents with more than 10 Level 4 data records with DLs below the residential RSL, or that were not detected in the pre-removal sampl

(6) RSL for thallium taken from May 2009 RSL Table; the RfD was subsequently withdrawn from IRIS.

Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2002a
Averaging Time - Noncarcinogens	Atnc	days	9125	= ED x 365
Exposure Frequency	EF	days/yr	225	USEPA, 2002a
Exposure Duration	ED	years	25	USEPA, 2002a
Inhalation rate	InhR	m^3/day	20	USEPA, 2002a
Soil Ingestion Rate	IR	mg/day	100	USEPA, 2002a(1)
Skin Surface Area for Soil Exposure	SAs	cm^2	3300	USEPA, 2002a
Soil Adherence Factor	AF	mg/cm^2	0.2	USEPA, 2002a

Notes:

kg kilograms
yr years
mg miligrams
cm^2 square centimeters
m^3 cubic meters
g grams
cm centimeters
ug micrograms
Shading indicates where RME parameter values differ from CTE parameter values.
(1) Outdoor worker

Table 6B
CTE Exposure Parameters - Industrial Worker

Parameter	Abbrev.	Units	CTE Value	Rationale
Body Weight	BW	kg	70	USEPA, 2002a
Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2002a
Averaging Time - Noncarcinogens	Atnc	days	3285	= ED x 365
Exposure Frequency	EF	days/yr	219	Professional Judgement
Exposure Duration	ED	years	9	Professional Judgement
Inhalation rate	InhR	m^3/day	20	USEPA, 2002a
Soil Ingestion Rate	IR	mg/day	25	Calabrese et al, 1991
Skin Surface Area for Soil Exposure	SAs	cm^2	3300	USEPA, 2004b
Soil Adherence Factor	AF	mg/cm^2	0.02	USEPA, 2004b

Notes:

kg	kilograms	cm	centimeters
yr	years	ug	micrograms
mg	miligrams		
cm^2	square centimeters		
m^3	cubic meters		
g	grams		

Table 7A
RME Exposure Parameters - Excavation Worker

Parameter	Abbrev.	Units	RME Value	Rationale
Body Weight	BW	kg	70	USEPA, 2002a
Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2002a
Averaging Time - Noncarcinogens	Atnc	days	182	26 weeks, 7 days/week
Exposure Frequency	EF	days/yr	260	5 days/week
Exposure Duration	ED	years	0.5	Professional judgement
Inhalation Rate	InhR	m^3/day		
Soil Ingestion rate	IR	mg/day	330	USEPA, 2002a
Skin Surface Area for Soil Exposure	SAs	cm^2	3300	U.S. EPA, 2002a
Soil Adherence Factor	AF	mg/cm^2	0.3	U.S. EPA, 2002a

Notes:

kg	kilograms	cm	centimeters
yr	years	ug	micrograms
mg	miligrams	L	liters
cm^3	cubic centimeters		Shading indicates where RME parameter values
m^3	cubic meters		differ from CTE parameter values.
g	grams		

For the purposes of this analysis the excavation worker is considered equivalent to a construction worker.

Table 7B
CTE Exposure Parameters - Excavation Worker

Parameter	Abbrev.	Units	CTE Value	Rationale
Body Weight	BW	kg	70	USEPA, 2002a
Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2002a
Averaging Time - Noncarcinogens	Atnc	days	84	12 weeks, 7 days/week
Exposure Frequency	EF	days/yr	260	5 days/week
Exposure Duration	ED	years	0.23	Professional judgement
Inhalation Rate	InhR	m^3/day		
Soil Ingestion rate	IR	mg/day	100	USEPA, 1991(1)
Skin Surface Area for Soil Exposure	SAs	cm^2	1900	USEPA, 1997(2)
Soil Adherence Factor	AF	mg/cm^2	0.1	USEPA, 2004b

Notes:

kg kilograms
yr years
mg miligrams
cm^3 cubic centimeters
m^3 cubic meters
g grams
cm centimeters
ug micrograms
L liters
(1) for moderate activities
(2) mean surface area for hands and forearms

For the purposes of this analysis the excavation worker is considered equivalent to a construction worker.

Table 8A
RME Exposure Parameters - Current/Future Trespasser

Parameter	Abbrev.	Units	RME Value	Rationale
Body Weight	BW	kg	45	USEPA, 2000a
Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2000a
Averaging Time - Noncarcinogens	Atnc	days	3650	= ED x 365
Exposure Frequency (Current Trespasser)	EF	days/yr	24	2 days/month
Exposure Frequency (Future Trespasser)			52	1 day/week(1)
Exposure Duration	ED	years	10	USEPA, 2000a
Inhalation rate	InhR	m^3/day	15	Professional Judgement
Soil Ingestion rate	IR	mg/day	50	USEPA, 2000a
Skin Surface Area for Soil Exposure	SAs	cm^2	3940	USEPA, 2004b(1)
Soil Adherence Factor	AF	mg/cm^2	0.2	USEPA, 2004b

Notes:

kg kilograms
yr years
mg miligrams
cm^2 square centimeters
m^3 cubic meters
g grams
cm centimeters
ug micrograms
Shading indicates where RME parameter values differ from CTE parameter values.
(1) Consistent with OU1 Trespasser scenario (EPS, 2011c).
(2) Represents head, hands, forearms, and lower legs.

Table 8B
CTE Exposure Parameters - Current/Future Trespasser

Parameter	Abbrev.	Units	CTE Value	Rationale
Body Weight	BW	kg	45	USEPA, 2000a
Averaging Time - Carcinogens	ATc	days	25550	USEPA, 2000a
Averaging Time - Noncarcinogens	Atnc	days	3650	= ED x 365
Exposure Frequency	EF	days/yr	6	1days/month, 6 months(1)
Exposure Duration	ED	years	10	USEPA, 2000a
Inhalation rate	InhR	m^3/day	15	Professional Judgement
Soil Ingestion rate	IR	mg/day	10	20% of RME Value
Skin Surface Area for Soil Exposure	SAs	cm^2	2750	USEPA, 2004b(2)
Soil Adherence Factor	AF	mg/cm^2	0.1	USEPA, 2004b

Notes:

kg kilograms
yr years
mg miligrams
cm^2 square centimeters
m^3 cubic meters
g grams
cm centimeters
ug micrograms
L liters

(1) The CTE exposure frequency is the same for the current and future scenarios.
(2) Represents face, hands, forearms, and lower legs.

Table 9A
RME Exposure Parameters - Hypothetical Resident

Parameter	Abbrev.	Units	RME Value	Rationale
Child Factors				
Body Weight	BW_c	kg	15	USEPA, 2002a
Soil Ingestion rate	IR_c	mg/day	200	USEPA, 2002a
Skin Surface Area for Soil Exposure	SAs	cm^2	2800	USEPA, 2002a
Soil Adherence Factor	AF	mg/cm^2	0.2	USEPA, 2002a

Notes:

(1) Where there was insufficient data for UCL calculations, the maximum detected concentration was used for an EPC

(2) Constituent identified as a COPC based on screening data from a comprehensive dataset from samples collected from the upper 5 ft of soil; all of the detected concentrations in that dataset were from samples below 2 ft.

(3) The EPC for Aroclor 1260 in Quadrant 4 was calculated using 1/2 the detection limit. The EPC using the full detection limit was 7.534 mg/kg.

Notes:
(1) Where there was insufficient data for UCL calculations, the maximum detected concentration was used for an EPC
(2) The EPC for Aroclor 1260 in Quadrant 4 was calculated using 1/2 the detection limit. The EPC using the full detection limit was 5.512 mg/kg

Table 12
Adult Lead Model Parameters

Calculations of Blood Lead Concentrations (PbBs)

U.S. EPA Technical Review Workgroup for Lead, Adult Lead Committee

Version date 6/21/09 **EDIT RED CELLS**

Variable	Description of Variable	Units	GSDi and PbBo from Analysis of NHANES 1999-2004	GSDi and PbBo from Analysis of NHANES III (Phases 1&2)
PbS	Soil lead concentration	ug/g or ppm	2240	1235
$R_{fetal/maternal}$	Fetal/maternal PbB ratio	--	0.9	0.9
BKSF	Biokinetic Slope Factor	ug/dL per ug/day	0.4	0.4
GSD_i	Geometric standard deviation PbB	--	1.8	2.1
PbB_0	Baseline PbB	ug/dL	1.0	1.5
IR_S	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.050	0.050
IR_{S+D}	Total ingestion rate of outdoor soil and indoor dust	g/day	--	--
W_S	Weighting factor; fraction of IR_{S+D} ingested as outdoor soil	--	--	--
K_{SD}	Mass fraction of soil in dust	--	--	--
$AF_{S,D}$	Absorption fraction (same for soil and dust)	--	0.12	0.12
$EF_{S,D}$	Exposure frequency (same for soil and dust)	days/yr	219	219
$AT_{S,D}$	Averaging time (same for soil and dust)	days/yr	365	365
PbB_{adult}	**PbB of adult worker, geometric mean**	**ug/dL**	**4.2**	**3.3**
$PbB_{fetal,\ 0.95}$	95th percentile PbB among fetuses of adult workers	ug/dL	10.0	10.0
PbB_t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	**10.0**	**10.0**
$P(PbB_{fetal} > PbB_t)$	**Probability that fetal PbB > PbB_t, assuming lognormal distribution**	**%**	**5.0%**	**5.0%**

Table 13
Toxicity Values for Constituents of Potential Concern

Analyte	Surrogate / Form	CAS No.	Oral CSF (mg/kg/day)$^{-1}$	Inhalation UR (ug/m^3)$^{-1}$	Dermal CSF (mg/kg/day)$^{-1}$	Oral RfD (mg/kg/day)	Inhalation RfC (mg/m^3)$^{-1}$	Dermal RfD (mg/kg/day)	GI ABS (unitless)	Dermal ABS (unitless)	PEF (m^3/kg)	VF (m^3/kg)

Notes:

(1) The EPC for Aroclor 1260 was calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, and the hazard and risk for this compound are 0.64 and 9.1E-06, respectively. The Total (Low Aroclor-1268) hazard and risk are 0.96 and 3.0E-05, respectively and the Total (High Aroclor-1268) hazard and risk are 1.5 and 3.0E-05, respectively.

Notes:

(1) The EPC for Aroclor 1260 was calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, aand the hazard and risk for this compound are 0.11 and 5.69E-07, respectively. The Total (Low Aroclor-1268) hazard and risk are 0.17 and 1.97E-06, respectively and the Total (High Aroclor-1268) hazard and risk are 0.27 and 1.97E-06, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 5.512 mg/kg, and the hazard and risk for this compound are 1.31 and 1.43E-08, respectively.

The Total (Low Aroclor-1268) hazard and risk are 2.15 and 1.36E-06, respectively and the Total (High Aroclor-1268) hazard and risk are 3.31 and 1.36E-06, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 5.512 mg/kg, and the hazard and risk for this compound are 0.36 and 4.67E-08, respectively.

The Total (Low Aroclor-1268) hazard and risk are 0.60 and 1.73E-07, respectively and the Total (High Aroclor-1268) hazard and risk are 0.92 and 1.73E-07, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, and the hazard and risk for this compound are 0.09 and 5.04E-07, respectively.

The Total (Low Aroclor-1268) hazard and risk are 0.14 and 1.58E-06, respectively and the Total (High Aroclor-1268) hazard and risk are 0.21 and 1.58E-06, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, and the hazard and risk for this compound are 0.01 and 6.8E-08, respectively.

The Total (Low Aroclor-1268) hazard and risk are 0.017 and 2.0E-07, respectively and the Total (High Aroclor-1268) hazard and risk are 0.028 and 2.0E-07, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, and the hazard and risk for this compound are 0.09 and 5.04E-07, respectively.
The Total (Low Aroclor-1268) hazard and risk are 0.14 and 1.58E-06, respectively and the Total (High Aroclor-1268) hazard and risk are 0.21 and 1.58E-06, respectively.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg, and the hazard and risk for this compound are 0.01 and 6.8E-08, respectively.

The Total (Low Aroclor-1268) hazard and risk are 0.017 and 2.0E-07, respectively and the Total (High Aroclor-1268) hazard and risk are 0.028 and 2.0E-07, respectively.

Lifetime Resident (Cancer Risk Only)[1]							4.1E-05		7.6E-09		7.9E-06		4.9E-05

Notes:
(1) Lifetime receptor risk was calculated by adding total child risk to the total adult risk times 0.8 (i.e., 24 yr/30yr) to yield a aggregate risk for the two receptors over the 30 year exposure period.

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg and the Total (Low Aroclor-1268) hazard and risk are 17.9 and 3.0E-04, respectively and the Total (High Aroclor-1268) hazard and risk are 27.9 and 3.0E-04, respectively.

	Total (Low Aroclor-1268)					1.5E+00	4.6E-06	1.3E-04	5.9E-11	6.2E-01	1.8E-06	2.16	6.3E-06
	Total (High Aroclor-1268)					2.7E+00	4.6E-06	1.3E-04	5.9E-11	1.2E+00	1.8E-06	3.95	6.3E-06
Lifetime Resident (Cancer Risk Only)[1]							6.3E-06		2.7E-10		3.0E-06		9.3E-06

Notes:
(1) Lifetime receptor risk was calculated by adding total child risk to the total adult risk times 0.8 (i.e., 24 yr/30yr) to yield an aggregate risk for the two receptors over the 30 year exposure period.

	Total (High Aroclor-1268)					5.7E+00	9.9E-06	4.4E-03	4.2E-11	2.6E+00	3.9E-06	8.35	1.4E-05
Lifetime Resident (Cancer Risk Only)[2]							1.4E-05		1.9E-10		6.6E-06		2.0E-05

Notes:

(1) The EPC for Aroclor 1260 was been calculated using 1/2 the detection limit. If the full detection limit is used, the EPC is 7.534 mg/kg and the Total (Low Aroclor-1268) hazard and risk are 7.4 and 4.3E-05, respectively and the Total (High Aroclor-1268) hazard and risk are 11.9 and 4.3E-05, respectively.

(2) Lifetime receptor risk was calculated by adding total child risk to the total adult risk times 0.8 (i.e., 24 yr/30yr) to yield an aggregate risk for the two receptors over the 30 year exposure period.

Notes:

(1) All RGO values are in units of mg/kg. Calculated RGO values greater than the applicable Soil EPC are not shown.

(2) RGOs based on theoretical cancer risk were calculated for the RME Lifetime Resident Scenario even thought the cumulative ELCR for this receptor (1.1E-4) does not exceed high-end of the CERCLA risk range (1E-4) when rounded to one significant digit.

Table 28

Uncertainty Analysis Summary

Source of Uncertainty	May Underestimate Risk	May Overestimate Risk	May Under or Overestimate Risk
Environmental Sampling and Analysis			
Systematic or random errors in the laboratory analyses of constituents			Low
Samples used to characterize conditions at the Site were collected from locations where it was anticipated to have the highest constituent concentrations		Moderate	
Data from the TEG laboratory were excluded from primary quantitative analysis	Low		
Fate and Transport Modeling			
Fate and transport modeling did not take into account biodegradation or other degradation processes.		Moderate	
Modeling did not take into account interactions that may occur among the different constituents which may influence their migration		Moderate	
Where site-specific data were not available, model input values were selected such that modeling concentrations were conservatively estimated		Moderate	
COPC Selection			
Some analytical detection limits were higher than risk-based screening levels		Moderate	
Surrogate risk-based screening levels used to screen constituents without available toxicity values	Low		
The risk estimates were based on the COPCs only--other constituents were not quantified.	Low		
Exposure Assumptions			
Only primary receptors based upon discussions with USEPA (2006a) of concern were evaluated. Other populations were not assessed/updated.	Low		
Only primary exposure pathways were evaluated. Other pathways were not assessed.	Low		
EPCs were based upon subdividing the site into quadrants.			Moderate
EPCs were based on the assumption that the data is lognormally distributed.			Moderate
Standard default upper-bound values were used to estimate exposures.		Moderate	
Soil ingestion rates may be uncertain		Moderate	
Skin surface area for on-site worker and excavation worker assumes wearing of short-sleeved shirts and no gloves		Moderate	
Exposure point concentrations for ambient outdoor air were based on modeled, rather than measured concentrations.			Moderate
Reasonable maximum exposure values were combined to arrive at the ADD and LADD estimates. There is a low probability that all of the various upper bound assumptions used in the exposure assessment would occur at the point of maximum constituent concentration.		Moderate	
Exposure point concentrations and the amount of media intake were assumed to be constant over time.		Low	

Table 28

Uncertainty Analysis Summary

Source of Uncertainty	May Underestimate Risk	May Overestimate Risk	May Under or Overestimate Risk
Toxicological Data			
RfDs are derived and extrapolated from laboratory animal studies that expose animals to relatively high intakes. Errors are inherent in the extrapolation of data from animals to humans, from high to low doses, and from one exposure route to another.		Moderate	
RfDs used to estimate non-carcinogenic risk are derived from NOAELs which are based on the sensitive endpoints in the sensitive species. As a result, extrapolation of toxicity data from animals to humans is uncertain. There may be differences in metabolism, uptake, or distribution of constituents in the body between animals and humans. To account for this, NOAELs are divided by uncertainty factors spanning several orders of magnitude to establish the RfD. The combination of these two conservative assumptions may establish RfDs which greatly overprotect human health.		Moderate	
CSFs used for the animal carcinogens are the 95% UCL derived from the linearized multistage model using animal chronic bioassay data, which tends to greatly overestimate carcinogenic risk in humans. The linearized multistage model ignores many known factors that have been documented to protect humans against the carcinogenic actions of constituents, such as DNA repair and immunosurveillence.		High	
RfD for aroclor 1254 used to extrapolate to aroclor 1248, 1260 and 1268		Moderate	
RfDs, CSFs and defensible carcinogenicity data were not available for some COPCs, which were therefore not quantitatively evaluated.	Low

Lifetime Resident (Cancer Risk Only)[1]							1.4E-05		2.5E-10		6.7E-06		2.0E-05

Notes:

(1) Lifetime receptor risk was calculated by adding total child risk to the total adult risk times 0.8 (i.e., 24 yr/30yr) to yield a aggregate risk for the two receptors over the 30 year exposure period.

EPS

APPENDIX B

RECOMMENDATIONS FOR DATA USAGE – HUMAN HEALTH BASELINE RISK ASSESSMENT (SUBMITTED TO USEPA AND EPD - JUNE 29, 2009)

EPS

Memorandum

Date: **29 June 2009**

To: **USEPA and Georgia EPD Human Health Risk Assessors**

From: **Kirk Kessler**

Subject: **Recommendations for Data Usage – Human Health Baseline Risk Assessment**
LCP Chemical Site, Brunswick Georgia
Operable Unit 3 (Upland Soils)

This memorandum is submitted to Agency human health risk assessment personnel to solicit input into the data selection and data usage conventions to be applied for the LCP Chemicals Site Human Health Baseline Risk Assessment (HHBRA), Operable Unit 3 (OU3 - Upland Soils). The Agency requested a new HHBRA be prepared for OU3 during a meeting on June 23, 2009, to replace a previous version from February 2007 with an addendum from March 2009. Agency personnel expressed a number of comments during the June 23, 2009 meeting regarding data extraction from the master LCP database and in particular commented upon the applicability of laboratory test records generated from the onsite laboratory for use in the HHBRA.

Data Selection

The first part of this memorandum explains the extraction of the appropriate data records from the master LCP database for use in the new HHBRA. The following database query conventions were used.

- No records were extracted with a 0 Northing, 0 Easting (i.e., unknown) coordinate position. Note that this convention also excludes all imported fill soil.
- Only soil matrix records were extracted.
- The onsite laboratory TEG (also shown as Teg in the database) were excluded (see further discussion below regarding this exclusion).
- Samples obtained in the cell building area that are now contained under the cell cap were excluded (Area = "CBD"). Other excluded areas include:
  - MH2O - Manhole 20 Area
  - MHO – Manholes
  - OTF - Offsite Tank Farm
  - OFF - Off Site
  - CRD - Canal Road
  - MSH - Marsh
- Sample locations that were remediated during the 1994-97 Upland Removal Response Action were excluded.
- Duplicate records (e.g., blind sample duplicate) were excluded.

- Samples below the groundwater table were excluded. This was accomplished by setting the top depth (D1) to < 5 feet below ground surface and bottom depth (D2) to <= 6 feet.

Table 1 is a listing of the data records extracted from the master database based upon these criteria.

TEG Onsite Laboratory Data Exclusion

TEG (also shown as Teg in the master database) was the first onsite laboratory used in support of the 1994-1997 Upland Removal Response Action. Early on during the removal response, the EPA Performance Evaluation (PE) program identified quality control issues with TEG, generally involving over-quantifying the true result for the analytes being tested. Thus TEG was soon replaced by a different onsite laboratory, QAL, which performed the onsite testing for the remaining duration of the upland removal action and passed all of EPA's PE testing programs. It is noted that any over-quantification by TEG in the analysis of the removal action samples would have resulted in more cleanup than necessary under the removal response action.

The TEG data are not well suited for the purpose of characterizing the risk for the HHBRA. One question with the exclusion of the TEG data is the remaining number of data records available for the HHBRA (after applying the selection criteria described above). Figure 1 shows the surface soil interval with respect to TEG and non-TEG sample locations (applicable to the Site Worker and Residential scenarios), and Figure 2 shows the surface/subsurface interval (applicable to the Excavation Worker scenario). Note that the exclusion of the TEG sample locations is approximately proportionally equivalent to the four exposure units (quadrants) and that a large number of sample locations remain for use in the risk characterization.

Note the following sample depth convention is proposed for the HHBRA

- Surface Soils (upper 1 ft): D1 (top depth) < 1ft; D2 (bottom depth) <= 2ft
- Subsurface Soils (upper 5ft): D1 (top depth) < 5ft; D2 (bottom depth) <= 6ft.

Handling of Elevated Detection Limits for Non-detect Sample Results

Typical convention for use of non-detect sample results in the risk characterization is the replace the non-detect result with ½ the sample detection limit. Non-detect samples with elevated detection limits can artificially inflate the computed risk, therefore it is prudent to examine the data set prior to undertaking the risk characterization. This issue will be examined for the constituents that contribute the most to the risk characterization:

- Aroclor 1258;
- Mercury; and
- Benzo(a)Pyrene.

Figure 3 shows the locations of Aroclor 1268 detections vs. non-detections in surface soils, and Figure 4 shows this for surface/subsurface soils. Aroclor 1268 non-detect results are presented in Table 2 for Surface/Subsurface Soils. There are 619 data records involving non-detect results. Of these, one has an extremely elevated detection limit (418 ppm) and is proposed to be omitted (affected data record shown in orange highlight on Table 2). The majority of the other non-detects are in the range of 2.00 to 3.56 ppm and are all associated with the QAL (onsite)

laboratory. Note the drop in detection limit associated with the offsite commercial laboratories non-detect results, ranging from 0.41 to 0.002 ppm. The large number on non-detect Aroclor 1268 data records in the range above 2.00 ppm will bias the risk computation high if ½ the detection limit value is used. Thus it is proposed to alter this convention by using the highest detection limit (0.41 ppm) associated with the offsite laboratories results as the surrogate value for non-detects with the QAL laboratory (affected data records shown in light yellow highlight on Table 2).

Detection limit values for non-detect mercury appear to be minimal and it is proposed to apply the typical convention of ½ the detection limit for the surrogate values of non-detect mercury in soil. Figure 5 shows the detect vs. non-detect locations in the surface/subsurface soil.

Detection limits are a consideration for the two PAH compounds, Benzo(a)Pyrene (BaP) and Dibenzo(a)Anthracene (DbA), that are significant contributors to the computed risk for the site. Figure 6 shows the locations of BaP detections vs. non-detections in surface soils, and Figure 7 shows this for surface/subsurface soils. BaP non-detect results are presented in Table 3 for Surface/Subsurface Soils. There are 535 data records involving non-detect results. Of these, 37 have elevated detection limits above the 10^{-5} remedial goal option value (2.3 ppm) and are proposed to be omitted (affected data record shown in orange highlight on Table 3). For the remainder of these data records, it is proposed to use ½ the detection limit as the surrogate value.

Figure 8 shows the locations of DbA detections vs. non-detections in surface soils, and Figure 9 shows this for surface/subsurface soils. DbA non-detect results are similar to BaP and are presented in Table 4 for Surface/Subsurface Soils. There are 589 data records involving non-detect results. Of these, 42 have elevated detection limits above the 10^{-5} remedial goal option value (2.3 ppm) and are proposed to be omitted (affected data record shown in orange highlight on Table 4). For the remainder of these data records, it is proposed to use ½ the detection limit as the surrogate value.
