NOTE(S)

1. ALL CONCENTRATIONS ARE IN mg/L.
2. J - ESTIMATED VALUE BETWEEN SQL AND MDL.
3. < - NOT DETECTED (RL/SQL REPORTED).
4. NA - NOT ANALYZED.
5. NS - NOT SAMPLED.
6. BLUE HIGHLIGHTED CONCENTRATIONS EXCEED COMMERCIAL INDUSTRIAL PCLs (FOR ON-SITE WELLS ONLY).
7. YELLOW HIGHLIGHTED CONCENTRATIONS EXCEED RESIDENTIAL ASSESSMENT LEVEL (RALs).
8. DNAPL - DENSE NON-AQUEOUS PHASE LIQUIDS DETECTED IN MONITORING WELL (JANUARY 2020).
9. * - SAMPLE COLLECTED IN MARCH 2020.

LEGEND

- UPRR PROPERTY BOUNDARY
- ROAD, PARKING LOT, SIDEWALK
- FENCE
- RAILROAD
- B-TZ MONITORING WELL LOCATION
- PLUGGED AND ABANDONED MONITORING WELL
- B-CZ (CLASS 3 GW)
- B-TZ/B-CZ BOUNDARY
- B-TZ (CLASS 2 GW)
- 0.001J — ARSENIC CONCENTRATION (mg/L)
- 0.01 — ARSENIC CONCENTRATION CONTOUR (mg/L)
- INFERRED GROUNDWATER FLOW DIRECTION
- ARSENIC PCLE ZONE

NOTE(S)

1. DNAPL - DENSE NON-AQUEOUS PHASE LIQUIDS DETECTED IN MONITORING WELL (JANUARY 2020).
2. NS - NOT SAMPLED
3. CONTOURS ARE BOLDED AT THE RAL AND C/I PCL:
   CLASS 2 GW PCL: 0.01 mg/L
   CLASS 3 GW PCL: 1 mg/L
4. * - SAMPLE COLLECTED IN MARCH 2020.

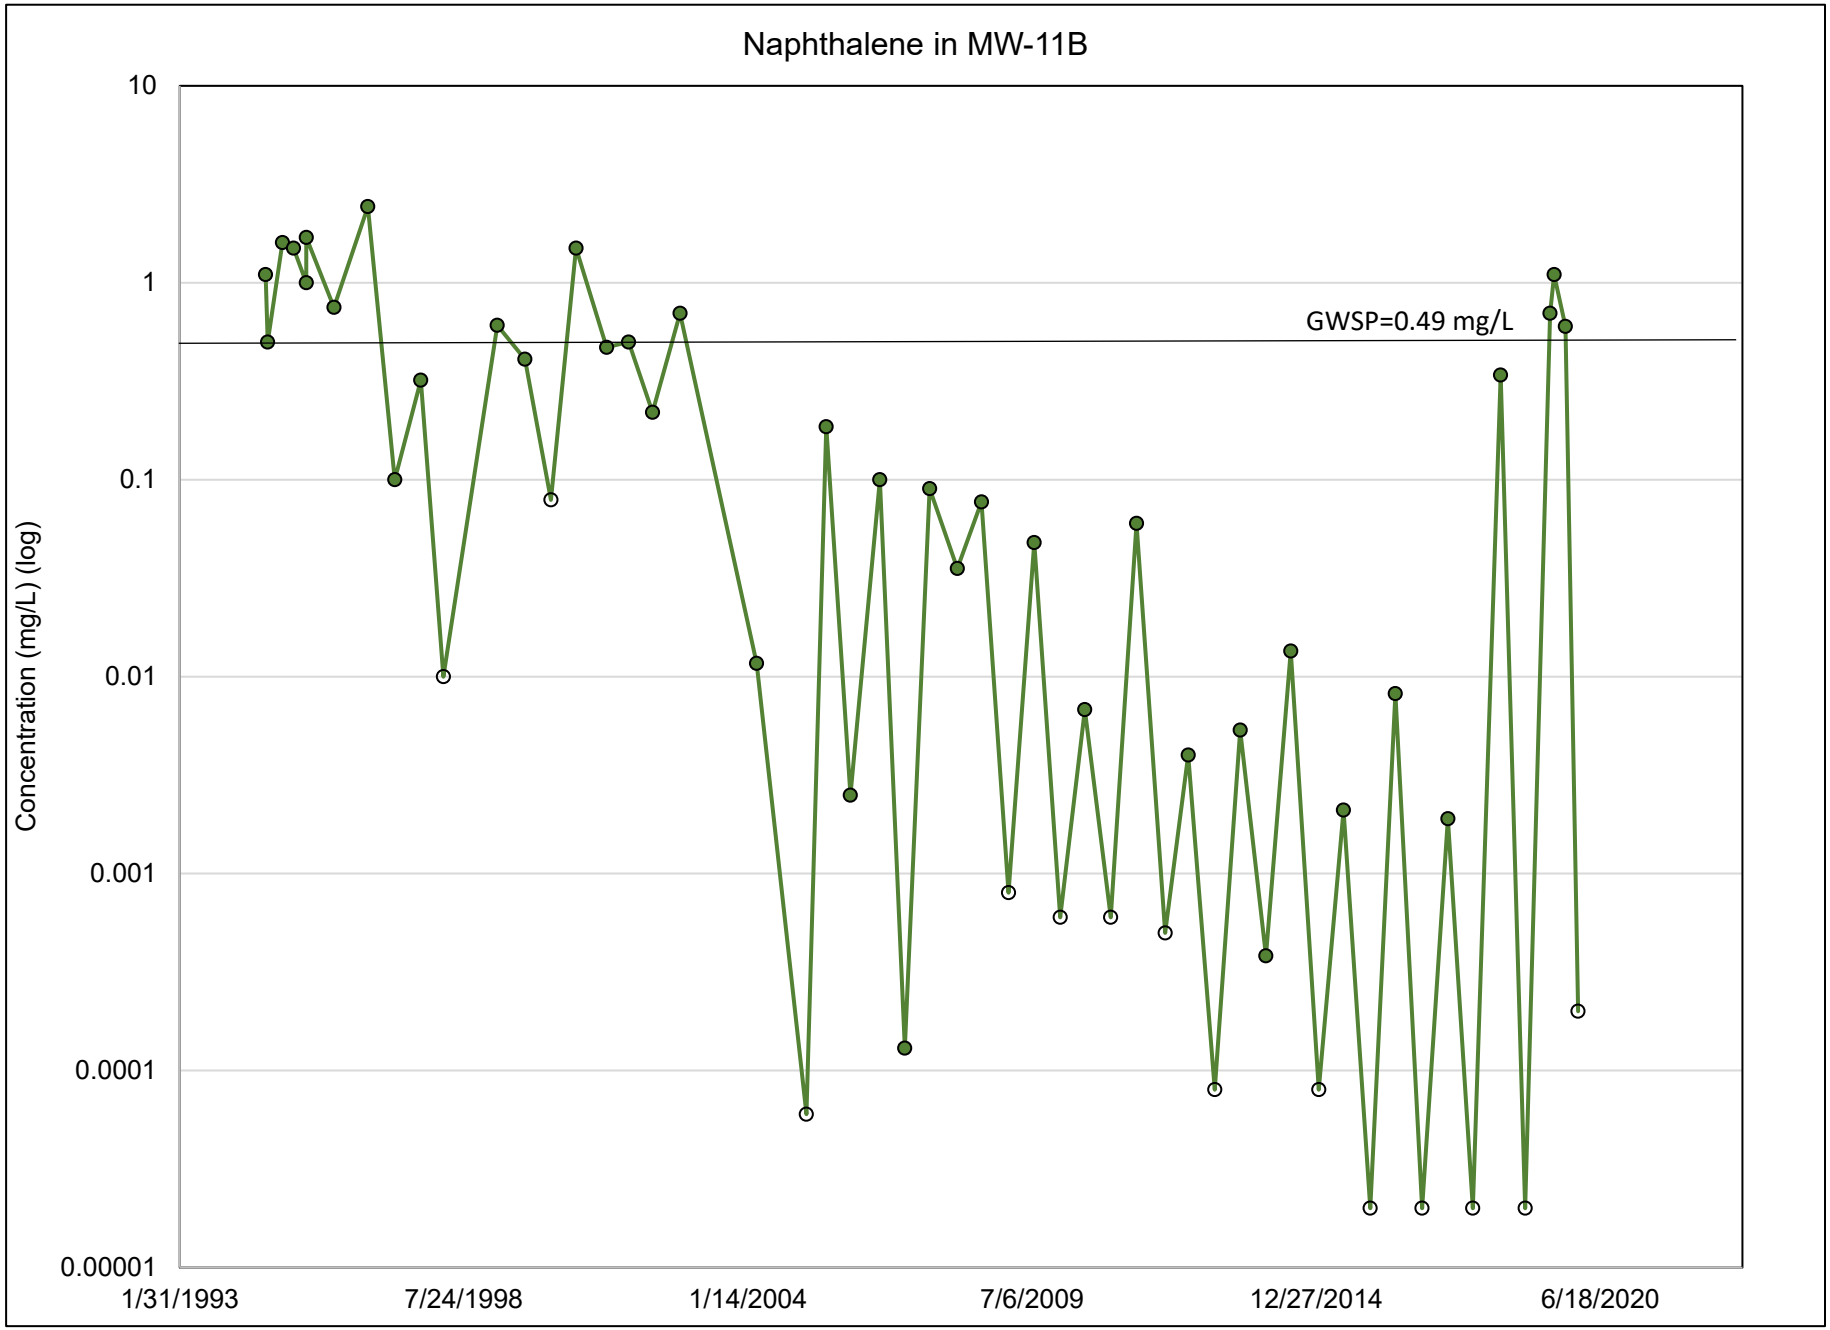
Notes:
1. Highlighted and bolded values exceed TCEQ Tier 1 Residential PCLs (November 2019)/ Groundwater Protection Standard (GWSP)
U - concentration below the method detection limit
J - estimate; concentration above the method detection limit & below the method quantitation limit



Note: Data points with no fill indicate that concentrations were below the method detection limit (MDL). The MDL is used as the result.

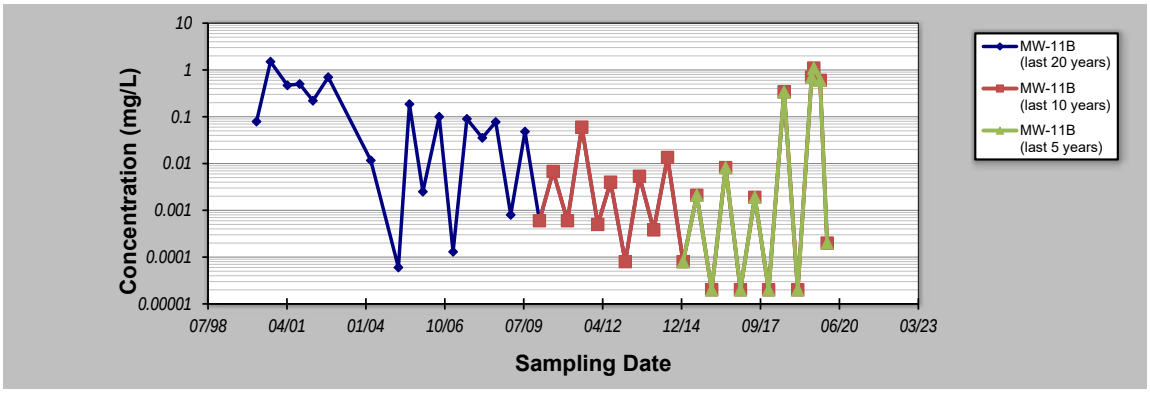
Concentration Trend:		Decreasing	No Trend	No Trend				



Notes:

1. At least four independent sampling events per well are required for calculating the trend. *Methodology is valid for 4 to 40 samples.*
2. Confidence in Trend = Confidence (in percent) that constituent concentration is increasing (S>0) or decreasing (S<0): >95% = Increasing or Decreasing; ≥ 90% = Probably Increasing or Probably Decreasing; < 90% and S>0 = No Trend; < 90%, S≤0, and COV ≥ 1 = No Trend; < 90% and COV < 1 = Stable.
3. Methodology based on "MAROS: A Decision Support System for Optimizing Monitoring Plans", J.J. Aziz, M. Ling, H.S. Rifai, C.J. Newell, and J.R. Gonzales, *Ground Water* , 41(3):355-367, 2003.

Subject: **Data Usability Summary**
HWPW - Groundwater Monitoring (New Wells)
Union Pacific Railroad (UPRR) / Houston TX-Wood Preserving Works
Houston, Texas
May-June 2020

1. Scope of Data Usability Study

This document details a Data Usability Summary (DUS) of analytical results for groundwater samples collected in support of the HWPW - Groundwater Monitoring (New Wells) at the Union Pacific Railroad (UPRR)/Houston TX-Wood Preserving Works site during May-June 2020. Samples were submitted to ALS Environmental (ALS), located in Houston, Texas and are reported in data packages HS20050915, HS20050997, and HS20060031. The intended use of the data is to support the HWPW - Groundwater Monitoring (New Wells) at the site by providing current concentration of chemicals of concern.

Data were reviewed and validated by Chris G. Knight of GHD, in accordance with Title 30 of the Texas Administrative Code Section 350.54 (30 TAC 350.54) as described in the Texas Commission on Environmental Quality (TCEQ) Regulatory Guidance document entitled "Review and Reporting of COC Concentration Data under TRRP", (RG-366/TRRP-13), revised May 2010, herein referred to as "TRRP-13 Guidance". Evaluation of the data was based on information obtained from the chain of custody forms, the finished report forms, method blank data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spikes (MS), duplicate data, field quality assurance/quality control (QA/QC) samples, the laboratory review checklists (LRC), and the laboratory exception reports (ER).

A sample collection and analysis summary is presented in Table 1. This summary provides a cross-reference of field sample identification numbers and location identification. Each sample is assigned a unique field identification number.

The validated sample results are presented in Table 2. A summary of the analytical methodology is presented in Table 3.

2. Laboratory Qualifications

The Laboratory's quality assurance program is consistent with the quality standards outlined in the National Environmental Laboratory Accreditation Program (NELAP). This laboratory was accredited under Texas Certification number # TX104704231 at the time the analysis was performed and the certificate is included in Attachment A.

3. Project Objectives

3.1 Sampling/Analytical QA/QC Objectives

The QA/QC program was designed to identify contamination resulting from the sampling, sample transport and analytical process through the analysis of trip blank samples, field duplicate sample sets, and method blanks. The QA/QC program was designed to evaluate the quality of the resulting data with respect to bias and precision through analysis of LCS, MS, and duplicate analyses.

4. Data Review/Validation Results

4.1 Sample Holding Time and Preservation

Samples were shipped with a chain of custody and the paper work was filled out properly. All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

The sample chain of custody documents and the analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

4.2 Sample Containers

Sample containers used were certified pre-cleaned glass and plastic containers provided by the laboratory. These containers meet or exceed analyte specifications established in the United States Environmental Protection Agency (USEPA) *Specifications and Guidance for Contaminant-free Sample Containers*.

4.3 Calibrations

According to the LRC, initial calibration and continuing calibration data met the criteria for the selected method.

4.4 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. As these were not discrete samples handled in the field, these blanks are not listed on the sample identification cross-reference list found in the data packages.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per twenty investigative samples and/or one per analytical batch and results are reported in the laboratory data packages.

The method blank results were non-detect or below the method quantitation limit (MQL), indicating that laboratory contamination was not a factor for this investigation.

4.5 Internal Standard and Surrogate Spike Recoveries

Recoveries of internal standards are addressed in the LRC of the data packages. All internal standard recoveries associated with the compounds of interest were acceptable per the LRC.

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) are spiked with surrogate compounds prior to sample analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project. Each individual surrogate compound is expected to meet the laboratory control limits. According to the TRRP-13 Guidelines, one outlying surrogate is acceptable for methods with multiple surrogate spike compounds as long as the recovery is at least ten percent. Samples analyzed at elevated sample dilutions (five times or greater) were not assessed.

Surrogate recoveries were assessed against laboratory control limits and/or the guidance in TRRP-13. All surrogate recoveries met the above criteria.

4.6 Laboratory Control Sample Analysis

LCS or LCS/laboratory control sample duplicate (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of one per twenty investigative samples and/or one per analytical batch.

The LCS or LCS/LCSD contained all analytes specified in the methods. All LCS recoveries and/or RPDs were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision (where applicable) with the following exception (see Table 4):

i) Two LCS/LCSD were reported with elevated RPDs for the following compounds: 4-nitrophenol, 4,6-dinitro-2-methylphenol, chrysene, and/or fluoranthene. Associated non-detect sample results would not be affected by the indicated variability. No further action was required. Associated detected sample results were qualified as estimated.

4.7 Matrix Spike Analysis

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with known concentrations of the analytes of interest

and analyzed as MS/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision.

MS/MSD analyses were performed as specified in Table 1. The recovery ranges established by the laboratory is adopted as the acceptance criteria for the project.

The MS/MSD samples were spiked with all analytes specified in the methods. All percent recoveries and the RPD value were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision.

The laboratory also performed additional MS/MSD analyses on non-site samples. These cannot be used to assess accuracy and precision for the site samples.

4.8 Duplicate Sample Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this study, duplicate samples were prepared and analyzed by the laboratory for arsenic analysis. The RPD established by the laboratory are adopted as the acceptance criteria for the project.

All duplicate analyses performed were acceptable, demonstrating acceptable analytical precision.

4.9 Field QA/QC Samples

The field QA/QC consisted of four trip blank samples and two field duplicate sample sets.

Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, four trip blank samples were submitted to the laboratory for VOCs analysis. All results were non-detect for the compounds of interest.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, two field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than thirty percent for water samples. The RPDs are only used when sample concentrations are above the estimated regions of detection.

Field duplicate summary data are presented in Table 2. All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

4.10 Field Procedures

Golder Associates, Inc. collected groundwater samples in accordance with their Standard Operating Procedures (SOP) for sample collection.

4.11 Analyte Reporting

The laboratory reported detected results for each analyte down to the sample detection limit (SDL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the MQL but greater than the SDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum.

The detectability check standard (DCS) results supported the laboratory MDLs.

5. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are usable for the purpose of supporting the HWPW - Groundwater Monitoring (New Wells) at the site by providing current concentration of chemicals of concern with the specific qualifications noted herein.

NELAP - Recognized Laboratory Fields of Accreditation

Certificate: T104704231-20-26

ALS Laboratory Group, Environmental Services Division (Houston, Texas)

Expiration Date: 4/30/2021

10450 Stancliff Road, Suite 210
Houston, TX 77099-4338

Issue Date: 5/1/2020

These fields of accreditation supercede all previous fields. The Texas Commission on Environmental Quality urges customers to verify the laboratory's current accreditation status for particular methods and analyses.

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 13 sample(s) on May 22, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20050915**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data

#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X			1
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?		X			2
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?		X			3
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?			X		
		Were analytical duplicates analyzed at the appropriate frequency?			X		
		Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
mg/L	Milligrams per Liter

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 5 sample(s) on Jun 01, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL
Dane J. Wacasey

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20060031**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20060031**	

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 06/09/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS20060031				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 154030,154094,R362573				
#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?		X			1
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?			X		
		Were analytical duplicates analyzed at the appropriate frequency?			X		
		Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X

		Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?	X				
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?	X				
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist: Exception Reports	
Laboratory Name: ALS Laboratory Group	LRC Date: 06/09/2020
Project Name: Houston TX-Wood Preserving Works	Laboratory Job Number: HS20060031
Reviewer Name: Dane Wacasey	Prep Batch Number(s): 154030,154094,R362573

ER#[5]	Description
1	Batch 154030, Semivolatile Organics Method SW8270D, LCS/LCSD were analyzed and reported in lieu of an MS/MSD for this batch.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
mg/L	Milligrams per Liter

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 10 sample(s) on May 26, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20050997**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 06/01/2020				
Project Name: WQ-1620-TB03-20200526			Laboratory Job Number: HS20050997				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 153854,153911,R362259				
#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?			X		
		Were % moisture (or solids) reported for all soil and sediment samples?			X		
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?		X			1
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?		X			2
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?			X		
		Were analytical duplicates analyzed at the appropriate frequency?			X		
		Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?	X				
		Were ion abundance data within the method-required QC limits?	X				
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?	X				
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?	X				
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

EXECUTIVE SUMMARY

This Interim Non-Aqueous Phase Liquid (NAPL) and Total Petroleum Hydrocarbon(TPH)-NAPL Assessment Report, prepared by Golder Associates Inc. (Golder) on behalf of Union Pacific Railroad (UPRR), details the supplemental NAPL and TPH-NAPL assessments requested by the Texas Commission on Environmental Quality (TCEQ) that were conducted at the UPRR Houston Wood Preserving Works (HWPW) Site (the Site) in 2019 and 2020.

The NAPL assessment consisted of 54 cone-penetrometer testing (CPT)/Tar-specific Green Optical Screening Tool (TarGOST®) laser-induced fluorescence (LIF) borings that were advanced to refine previous assessments of the lateral and vertical extent of Dense NAPL (DNAPL) in the subsurface. TarGOST® borings were advanced in three areas: (1) off-site, generally north of the HWPW Site; (2) along and adjacent to the northern and western perimeter of the Site; and (3) within the Englewood Intermodal Yard in the Site interior. The assessment indicated the following for each area:

- Off-Site: There is no evidence of NAPL present off-site to the north of Liberty Road and north of the Site, within the A-Cohesive Zone (A-CZ) (vadose zone) or the A-Transmissive Zone (A-TZ). TarGOST® data from off-site borings to the north indicate the presence of NAPL in the B-Cohesive Zone/ B-Transmissive Zone (B-TZ/B-CZ), at a general depth of 24 or more feet below ground surface (bgs) and the extent of NAPL in the B-TZ/B-CZ in this area is limited to an approximate distance of 500 feet or less from the Site boundary.
- Northern and Western Perimeter of the Site: The extent of NAPL within the vadose zone, A-TZ, and B-CZ/B-TZ is delineated to the east and west along the northern perimeter of the HWPW site. TarGOST® signals indicating the potential presence of NAPL in the vadose zone and the A-TZ along the northern perimeter are consistent with historical observations, except at CPT-12-20 and CPT-13-20. Previous CPT-Rapid Optical Screening Testing (ROST™) borings had not identified elevated ROST™ responses in the vadose zone and A-TZ near TarGOST® borings CPT-12-20 and CPT-13-20. The extent of NAPL within the vadose zone, A-TZ, and B-CZ/B-TZ is delineated to the north, west, and south at the western perimeter of the HWPW site based on observations in TarGOST® borings, soil borings and groundwater sampling data. In-well DNAPL thickness measurements have been observed in B-CZ/B-TZ monitoring wells MW-12B and MW-41B on the west side of the Site; however, TarGOST® signals from all but two CPT borings in this vicinity did not indicate the potential presence of NAPL in the B-CZ/B-TZ. These data, coupled with the absence of measurable DNAPL in the nearby B-CZ/B-TZ monitoring wells, suggest a very localized area of NAPL in this unit within this area of the Site.
- Englewood Intermodal Yard: TarGOST® data in the Englewood Intermodal Yard indicate that NAPL is present in the vadose zone, the A-TZ, and the B-CZ/B-TZ, mainly near the former lagoon and former aboveground storage tank (AST) areas identified on historical aerials and maps. The TarGOST® data indicated that the extent of NAPL in each zone in the Englewood Intermodal Yard is delineated to the west, south, and east.

Findings were based on a combination of observations made from the CPT/TarGOST® data, previously collected CPT-ROST™ data, observations of DNAPL in monitoring wells, geologic boring logs, and recently collected groundwater data. TarGOST® data that indicate the presence of NAPL will be used in conjunction with other investigation data to support development of the response action objectives and support the remedial design of potential DNAPL recovery activities, which will be presented in the Revised Response Action Plan (RAP).

The TPH-NAPL assessment consisted of 56 soil samples from 28 soil borings to evaluate the horizontal and vertical extent of TPH concentrations in soils and identify possible source characteristics for TPH in soils at the Site. Following TCEQ guidance, a preliminary evaluation of TPH concentrations (TX1005 data) in soils was conducted by comparing the soil results to applicable screening level Texas Risk Reduction Program (TRRP) Protective Concentration Levels (PCLs). Results from the soil assessment indicate that TPH concentrations in soils exceeded applicable screening level TRRP PCLs on the western and northern perimeter of the Site and near the center of the Site in the Englewood Intermodal Yard. The NAPL assessment within the Englewood Intermodal Yard indicated total TPH TX1005 concentrations in eight soil samples exceeded the Tier 1 $Soil_{Res}$ PCL of 10,000 mg/kg, located within the former AST area and general area of the former lagoons within the Englewood Intermodal Yard. At each of these soil boring locations, either NAPL was visually observed or strong hydrocarbon odors were noted on the soil boring logs. The soil TPH TX1005 results are delineated to less than the Tier 1 $Soil_{Res}$ PCL to the north, south, east, and west.

Based on the profile of the predominant peaks in gas chromatograms and fractionation data, the TPH results for the soil samples were assigned four categories of different TPH types. Samples with elevated TX1005 TPH concentrations and different compositional distributions were selected for TX1006 analyses to develop TPH Mixture critical PCLs for each category identified. The soil samples with the highest total TPH concentrations were chosen as representative samples of each category and Tier 1 PCLs for Total TPH Mixture were calculated. The calculated Tier 1 TPH Mixture PCLs were used as critical PCLs to evaluate the total TPH by TX1005 Method soil sample concentration data. None of the soil samples had total TPH concentrations greater than the calculated commercial/industrial Tier 1 TPH Mixture critical PCLs, and therefore there is no Total TPH PCLE Zone for soils at the Site. However, one soil sample collected at DPT-12-20 (8-9 feet below ground surface) (adjacent to CPT-12-19) near the northern perimeter of the Site had total TPH concentrations that exceeded the calculated residential critical PCL. Additional sampling closer to the property boundary north of DPT-12-20 is recommended to evaluate the lateral extent of the total TPH concentrations exceeding the residential Tier 1 TPH Mixture critical PCL in the surface soils.

1.0 INTRODUCTION

This Interim Non-Aqueous Phase Liquid (NAPL) and Total Petroleum Hydrocarbon (TPH)-NAPL Report (Interim NAPL-TPH Report) was prepared by Golder Associates Inc. (Golder), on behalf of Union Pacific Railroad (UPRR), to summarize supplemental NAPL and TPH-NAPL assessments conducted at the UPRR former Houston Wood Preserving Works (HWPW) site (the Site). The supplemental assessments were requested by the Texas Commission on Environmental Quality (TCEQ) in a Technical Notice of Deficiency (TNOD) letter dated April 11, 2019, which included the following comment:

> *General Comments T35(4), T42(4), T44(4), and T45(4): Since the TCEQ is requiring UPRR to conduct further assessment of TPH-NAPL in the Englewood Intermodal Yard cap area as directed in the TCEQ February 6, 2019 letter and a VI assessment as directed in Comment T59 of this NOD, the additional assessment should include a re-assessment of creosote DNAPL using cone penetrometer/ rapid optical screening tool (CPT/ROST™).*

UPRR provided a description of the proposed supplemental NAPL and TPH-NAPL assessments in Worksheet 2.0 of the Conceptual Response Action Plan (RAP) – Revision No. 4 dated July 9, 2019 (Golder, 2019a). TCEQ issued a notice to proceed with proposed additional assessments with certain modifications as requested in a letter dated September 6, 2019. UPRR, Golder, and TCEQ met on September 23, 2019 at the TCEQ Austin Office to discuss the modifications to the assessments. Golder, on behalf of UPRR, submitted a response letter dated October 23, 2019 to the TCEQ September 6, 2019 letter summarizing the modifications agreed upon during the meeting. The TCEQ issued a notice to proceed with proposed NAPL and TPH-NAPL assessments as revised in the October 23, 2019 letter in a letter dated December 13, 2019.

A description of the additional NAPL assessment and TPH-NAPL assessment activities and an evaluation of the data collected are provided in the following sections.

2.0 NAPL ASSESSMENT

In response to the TCEQ's request for re-assessment of Dense NAPL (DNAPL) and to refine the observed subsurface distribution of DNAPL at the Site, Golder conducted the additional DNAPL assessment activities pursuant to the general scope detailed in the Conceptual RAP as modified in the October 23, 2019 letter and approved by TCEQ. A brief summary of the primary objectives of the assessment activities are presented below:

- Refine previous assessments of the lateral and vertical extent of DNAPL in the subsurface;
- Further update the historical DNAPL/subsurface conceptual site model (CSM) by reviewing results from previous investigations (over 90 previous cone-penetrometer testing (CPT)/Rapid Optical Screening Tool™ (ROST™) laser-induced fluorescence (LIF) borings) with the activities conducted as part of this investigation;
- Support design of potential DNAPL recovery activities (e.g., additional recovery wells) or systems, as appropriate; and
- Update the subsurface DNAPL CSM to support the risk-based DNAPL management plan to be developed in accordance with TCEQ guidance provided in RG-366 (Risk-Based NAPL Management; Texas Risk Reduction Program (TRRP-32) (TCEQ, 2013).

This Interim NAPL-TPH Report includes information to address the first two bullets, with the design of potential DNAPL recovery activities and the updated risk-based NAPL management plan to be provided in the Revised RAP that will submitted to the TCEQ by August 31, 2020.

2.1 Background

As discussed in the previous APARs and in the RAP, certain areas of the shallow groundwater bearing units (GWBUs) at the Site contain creosote-related DNAPL and associated dissolved chemicals of concern (COCs) at concentrations above their respective critical Protective Concentration Levels (cPCLs). The sources of DNAPL are likely from former operations at the Site.

Since 1995, site investigations have included activities to evaluate surface and subsurface soils for the presence of NAPL. Specifically, CPT/ROST™ investigations were conducted in 1995, 2001, 2008, and 2013 at the Site using laser-induced fluorescence (LIF) to identify the presence of NAPL (Figure 1). As part of these investigations over 100 CPT/ROST™ borings and over 300 soil borings have been installed at the Site. Based on soil borings, measured DNAPL thicknesses in existing wells, and ROST™ readings, the occurrences of NAPL in the A-Cohesive Zone (A-CZ or vadose zone), the A-Transmissive Zone (A-TZ), B-Cohesive Zone/ B-Transmissive Zone (B-TZ/B-CZ), and C-Transmissive Zone (C-TZ) were described in the updated APAR addendum dated October 22, 2010 (PBW, 2010) and Attachment 2G (Technical Impracticability Demonstration Document) of the Response Action Plan (RAP) Revision 2 dated July 20, 2016 (PBW, 2016). As detailed in these documents, evidence of DNAPL from the ROST™ borings was generally observed in the following areas within these lithologic intervals:

- Vadose zone and the A-TZ - The majority of the elevated ROST™ readings (i.e., >25 units of fluorescence percent response (% RE)) in the vadose zone and A-TZ were located in and around the HWPW Recent Process Area, Original Process Area, and the AST Area (SWMUs 4, 5, and 8, respectively), and extended into the northern portions of the Englewood IM Yard. The elevated ROST™ readings were generally consistent with intervals where NAPL was visually observed in soil borings for A-TZ wells, except for in the Englewood Intermodal Yard area. NAPL was noted on the boring logs for A-TZ wells MW-78A and MW-79A installed in the Englewood Intermodal Yard. However, there were no elevated ROST™ readings in this area of the Site. This may indicate the NAPL may have degraded through natural weathering/depletion process in this area of the Site, and as a result was less likely to be detected with the ROST™ tool.
- B-CZ/B-TZ - The majority of the elevated ROST™ readings in the B-CZ/B-TZ are in the vicinity of SWMUs 4 and 5. However, elevated ROST™ readings were observed in the B-CZ north of the Site at CPT/ROST™ boring CPT-43R-08, near MW-70B. The ROST™ readings in this area are consistent with the observations of NAPL in monitoring well soil borings in the B-CZ (i.e., MW-70B). Elevated ROST™ readings were also noted in the Englewood Intermodal Yard area (CPT-14-13). Monitoring wells MW-74B (installed within an area noted with >25% RE ROST™ readings) and MW-75B were installed in December 2011 in the Englewood Intermodal Yard to evaluate the presence of DNAPL in the B-CZ. NAPL was noted in the boring log in the B-CZ for both wells. However, no DNAPL has been detected in MW-74B during the 19 gauging events performed since well installation. In contrast, no significant ROST™ readings were noted for CPT/ROST™ borings CPT-07-13 or CPT-10-13 in the Englewood Intermodal Yard, but DNAPL has been observed in monitoring well MW-75B located in the immediate vicinity of CPT-07-13. As with the A-TZ, the NAPL in this area may be more degraded through weathering/depletion processes and less likely to be detected with the ROST™ tool. DNAPL has also been observed in wells

MW-12B and MW-41B on the western side of the Site, but minimal ROST™ responses were noted for that area; and

- C-TZ – Despite the C-TZ depth (top of unit approximately 65 feet below ground surface) being near the maximum limit of CPT penetration, 13 CPT/ROST™ borings were able to be advanced into or through the C-TZ. Most CPT borings reach refusal either at the top of the C-TZ or shallower and could not be advance through that unit. For the CPT/ROST™ borings that did advance into the C-TZ, the elevated ROST™ responses were relatively lower than the other GWBUs and centered near SWMU 5 (Original Process Area). DNAPL has been observed in C-TZ wells on the northeastern side of the Site and off-site to the northeast.

Based on this background information, Golder and UPRR working with the TCEQ developed the NAPL assessment plan detailed in the Conceptual RAP and modified in the October 23, 2019 letter to re-evaluate the NAPL at the Site. Details of the NAPL assessment methods are described in the sections below.

2.2 Assessment Methods

As part of the re-assessment of the DNAPL at the Site, Golder evaluated different qualitative NAPL screening tools for possible application at the Site. As discussed in Section 2.1, ROST™ LIF borings had been conducted at the Site during the previous NAPL assessment events. ROST™ LIF readily detects creosote and coal tar in the subsurface. However, the relative response sensitivity of the ROST™ LIF tool for coal tar and creosote is less when compared to responses to petroleum hydrocarbons such as gasoline, diesel fuel, and jet fuel (EPA, 1997). More recently, additional optical screening tools, such as the Tar-specific Green Optical Screening Tool (TarGOST®), have been developed to target heavier end petroleum hydrocarbons including creosote and coal tar. TarGOST® is a proprietary site characterization tool designed by Dakota Technologies (Dakota) for assessing NAPL, including DNAPL commonly encountered at wood treatment sites that used creosote-based preservation. Creosote DNAPLs typically contain large amounts of naturally fluorescent polycyclic aromatic hydrocarbons (PAHs). TarGOST® was specifically designed to screen for heavy molecular weight NAPL phase PAHs versus depth (Dakota, 2020; Attachment A).

As detailed in the Conceptual RAP – Revision 4 (Golder, 2019a), Golder, on behalf of UPRR, proposed to conduct the NAPL assessment using the TarGOST® system with the TarGOST® tool advanced by a CPT rig. Upon TCEQ approval of the proposed scope of work as described above, 54 CPT/TarGOST® borings were collected in three areas of the Site between December 2019 and January 2020:

- Off-site – CPT/TarGOST® borings were advanced within the City of Houston right-of-way (ROW) in the residential area north of the Site.
- Perimeter of the HWPW Site – CPT/TarGOST® borings were advanced along the west side of the Site near monitoring wells MW-41B and MW-12B, in which DNAPL has been observed, and along the north side of the Site between MW-15B and MW-18C.
- Englewood Intermodal Yard – CPT/TarGOST® borings were advanced in the areas of the former ASTs and former lagoons identified on historical aerials and maps in the Englewood Intermodal Yard and along the eastern side of the yard between MW-49B and MW-80B.

The TarGOST® system was installed within probe rods on a 20-ton Geoprobe® 2060CPT rig. Details of the TarGOST® system and setup are provided in the Dakota report provided in Attachment A. The subsurface was logged with the CPT probe and TarGOST® simultaneously. CPT is an in-situ method where a cone is pushed

into the ground to collect measurements to identify general soil type. Tip resistance on the cone, friction in the sleeve of the cone, and pore pressure in the soil are recorded as the cone is advanced.

Prior to conducting the CPT/TarGOST® borings, hydrovac excavation methods (i.e., excavation using a high-pressure water probe and vacuum) were used to clear the top 10 feet at each CPT/TarGOST® location for the presence of underground utilities and backfilled with sand at all locations and capped with an asphalt patch at off-site locations before drilling commenced. Each location was drilled to a depth of approximately 65 feet below ground surface (feet bgs) or shallower where the CPT rig reached refusal. Rods were decontaminated with pressurized water as they were removed from the ground. Each location was plugged with bentonite grout tremied from the bottom of the hole to ground surface using a direct push technology (DPT) rig to ensure the CPT holes were properly plugged. In addition, a TarGOST® reading was collected of a sample of the tar-like material that seeps up between the cracks of the Englewood Intermodal Yard in Rows A and B and is provided in Attachment A.

Advancement of the CPT probes was attempted more than once at several locations to reach the targeted depth. These locations are marked with an “A” following the location ID. For example, the rig reached refusal at CPT-19-20 at approximately 31 feet bg. Another attempt was made adjacent to the original location and was labeled CPT-19A-20.

TarGOST® logs collected at the Site are provided in Appendix A of Attachment A. The CPT logs collected at the Site in 2019 and 2020 are provided in Attachment B. CPT/TarGOST® locations were surveyed by a licensed, professional surveyor to Texas State Plane coordinates (NAD 27, Texas South Central, U.S. Feet).

2.3 Data Evaluation

TarGOST® logs provide a qualitative tool for evaluating the potential presence of NAPL in the subsurface. However, interpretation of the TarGOST® logs is needed to evaluate a fluorescence response (i.e., total fluorescence area relative to the total area of the Reference Emitter (%RE)) signal or range of signals that represents a potential for the presence or absence of NAPL. To preliminarily evaluate the potential for NAPL in the subsurface based on the TarGOST® signals, TarGOST® signals were compared to the presence of DNAPL in nearby monitoring wells (CPT-04-20 and monitoring well MW-32B and CPT-06-20 and MW-70B) and/or soil boring logs nearby. Based on CPT/TarGOST® data adjacent to wells with DNAPL, the following general preliminary observations were made:

- Signals over 20%RE may indicate NAPL zones where NAPL could potentially flow into wells completed across those zones (depending on lithological/hydrogeologic and NAPL conditions).
- Signals between 5% and 20%RE may indicate the presence of residual NAPL, but the lower %RE suggests that the NAPL is not likely to flow into a well installed at that location.
- Signals below 5%RE may indicate that no NAPL is present based on a review of TarGOST® data, comparison to existing boring logs, and potential for interferences.

It is important to note that the above general and preliminary observations should only be used as a guide for the purposes of discussing the TarGOST® data in this report. Multiple lines of evidence including TarGOST® data, nearby monitoring wells, and soil borings will be used to confirm the presence or absence of NAPL.

As part of the evaluation, Golder prepared contour maps of the maximum RE% readings from the TarGOST® logs within the vadose zone, the A-TZ, and the B-CZ/B-TZ provided as Figures 2 through 4, respectively. Golder also prepared summary tables (Tables C-1 through C-3 in Attachment C) of the maximum TarGOST® signals (RE%)

detected in two-foot intervals from each CPT/TarGOST® location to the total depth. TarGOST® %RE on the tables are color-coded on a graded scale; with values over 5% highlighted light yellow to yellow as the values increase, and at 20%RE and greater, the color scales from yellow to orange. TarGOST® logs were compared to nearby CPT/ROST™ borings and observations made in boring logs. Select log comparisons and a cross-section of the northern perimeter of the Site are provided in Attachment D.

The evaluation of TarGOST® logs at the Site is organized by the three areas that were evaluated during the 2019/2020 NAPL assessment activities (off-site, perimeter of the HWPW Site, and Englewood Intermodal Yard) and by lithologic intervals (vadose zone, A-TZ, and B-TZ/B-CZ). Of the 54 CPT/TarGOST® borings conducted at the Site, only 8 borings were advanced to the top of the C-TZ and none were able to penetrate through the C-TZ. As a result, the C-TZ is not evaluated in this report. Also, since the CPT/TarGOST® locations were pre-cleared to 8 to 10 feet bgs for utilities via hydro-excavation and backfilled with sand and an asphalt patch, TarGOST® data collected in the pre-cleared interval are considered unreliable and are not evaluated below.

TarGOST® signals vs depth logs, including spatial variability and elevated %RE signals for each of the three areas evaluated are discussed in Section 2.3.1. TarGOST® data are presented on Signal (%RE) vs depth logs and cluster diagrams. Both formats were reviewed and are included in Appendix A of Attachment A. Differences in waveforms and cluster diagrams are described in Section 2.3.2.

2.3.1 TarGOST® Responses

Off-site CPT/TarGOST® Locations

TarGOST® and CPT data were collected at CPT-01-20 through CPT-11-20 north of Liberty Road in the City of Houston right-of-way north of the Site (Figure 1). CPT-23-20 was drilled off-site northeast of the Site. CPT-01-20 through CPT-11-20 and CPT-23-20 ranged in depth from 52 to 60 feet bgs. Refusal was reached at approximately 20 feet bgs at CPT-07-20 during the first attempt. A solid-point tip was advanced past the refusal depth and TarGOST® logging resumed at the original location. Details of TarGOST® signals observed off-site are provided below.

Vadose Zone

As shown on Figure 2 and on Table C-1 of Attachment C, TarGOST® signals in the vadose zone at locations north of the Site were below 5%, which indicates the absence of NAPL and is consistent with previous investigations conducted off-site (PBW, 2010; PBW, 2016).

A-TZ

TarGOST® signals in the A-TZ (top of unit ranges from 11 to 18 feet bgs and bottom ranges from approximately 21 to 25 feet bgs) north of the Site were all below 5%RE (Figure 3; Table C-1 in Attachment C). Based on a combination of observations made in boring logs, previously collected ROST™ data, and the 2019/2020 CPT/TarGOST® data, there is no evidence of off-site NAPL within the A-TZ. Concentrations of chemicals of concerns (COCs) in groundwater samples collected from A-TZ wells during semi-annual monitoring events presented in the Interim Groundwater Monitoring Report (Golder, 2020) were below detection limits or multiple orders of magnitude below applicable TCEQ TRRP critical protective concentration levels (cPCLs). The groundwater data further support the conclusion that NAPL is not present off-site in the A-TZ.

B-CZ/B-TZ

TarGOST® signals exceeding 20%RE were observed in the B-CZ/B-TZ in off-site locations CPT-02-20, CPT-04-20, CPT-06-20, and CPT-08-20, which are located just north of the Site near monitoring wells MW-35B, MW-32B, MW-70B, and MW-71B, respectively (Figure 4; Table C-1 in Attachment C). DNAPL has been observed in wells MW-32B and MW-70B, that are part of the on-going DNAPL recovery program. The highest TarGOST® signals in the B-CZ/B-TZ are generally found at depths consistent with observations of NAPL in boring logs and elevated ROST™ readings discussed in Attachment 2G of the RAP Revision 2 (PBW, 2016). These depths correspond to where thin carbonate clayey gravel and nodule seams (~0.1 feet thick) have been described within the B-CZ. The depths of the TarGOST® signals exceeding 20%RE were generally between 26.9 and 40.7 feet bgs, as detailed below:

- The highest TarGOST® signal in CPT-02-20 was logged approximately 34.91 to 40.68 feet bgs (~20 to 57%RE), which is consistent with the observation of visible NAPL on the boring log of MW-35B (installed in 2007) at 36 feet bgs (Figure D-1 in Attachment D). Even though MW-35B is located within 50 feet of CPT-02-20 and is screened across the interval that had the elevated TarGOST® signal, no in-well NAPL has been noted at MW-35B since installation in 2007, suggesting that notwithstanding the TarGOST® %RE measurements in CPT-02-20, the DNAPL may only be at residual saturation at this location and not migrating.
- The highest TarGOST® signal in CPT-04-20 was logged approximately 26.93 to 31.11 feet bgs (~20 to 52%RE), which is consistent with the interval on boring log of MW-32B where NAPL was noted and the elevated ROST™ responses at CPT-42R-08 in 2008 (Figure D-2 in Attachment D). DNAPL has been regularly detected in MW-32B with in-depth thicknesses ranging from 1 foot to over 5 feet thick during the 1st quarter of 2020.
- The highest TarGOST® signal in CPT-06-20 was logged approximately 25.82 to 29.33 feet bgs (~20 to over 120%) and is consistent with observations (strong odor) noted on the boring log for nearby well MW-70B. This interval is represented by sandy and silty clay with abundant carbonate gravel seems within the clay unit. DNAPL has been detected in MW-70B, which is screened across the interval that had elevated TarGOST® signal (Figure D-3 in Attachment D). DNAPL has been regularly detected in MW-70B with in-depth thicknesses ranging from 3 feet to over 5 feet thick during the 1st quarter of 2020.
- The highest TarGOST® response in CPT-08-20 was near 34.87 feet bgs (~20 to 30%RE). Trace NAPL staining was noted on the boring log of nearby well MW-71B in sand and gravel seams at similar depths. In-well DNAPL has not been observed at MW-71B, suggesting that NAPL will not flow into wells at this location.

TarGOST® signals at CPT-03-20 (north of CPT-04-20) were between ~5 and 9%RE from approximately 29 to 32 feet bgs. NAPL staining was noted on the boring log of MW-68B between 34.5 and 35 feet bgs during installation in 2011, indicating the presence of NAPL then (Figure D-4 in Attachment D). Up until recently, no DNAPL has been observed in adjacent MW-68B. Since January 2020, in-well DNAPL thickness at MW-68B has ranged from less than 1 foot to over 3 feet thick, and the well has been incorporated into the DNAPL recovery well network. The relatively low TarGOST® signals at CPT-03-20 are anomalous when compared to other CPT/TarGOST® locations that were advanced near wells with DNAPL present. This anomaly may be due to isolated pockets of DNAPL within calcareous nodule beds, as noted on the boring log for MW-68B and demonstrates a possible limitation of the TarGOST® technology.

TarGOST® signals at CPT-07-20 (north of CPT-08-20) were between ~5 and 16%RE from approximately 28 to 39 feet bgs. Trace NAPL was noted within this depth interval on the MW-33BR boring log, a well located approximately 240 feet west of CPT-07-20 (Figure 4). DNAPL has not been observed in MW-33BR since

installation in 2011. Another monitoring well (MW-87C), located approximately 75 feet north of CPT-07-20, did not have NAPL noted on the boring log (Figure 4).

TarGOST® signals were below 5%RE in the B-CZ/B-TZ at CPT-01-20, CPT-05-20, CPT-09-20, and CPT-10-20. These signals indicate that the extent of NAPL is delineated off-site to the north. The boring log for monitoring well MW-63B installed in 2009 located just north of CPT-05-20 indicated NAPL in the B-CZ; however, no DNAPL has been observed in that well. TarGOST® signals were between 5 and 6%RE near 39.5 feet bgs at CPT-11-20 located east of CPT-09-20. TarGOST® signals at CPT-23-20, located northeast of the CPT-11-20 and the Site, were between ~5 and 7%RE from approximately 32 to 33 feet bgs. Monitoring well MW-54B was installed near CPT-23-20 in February 2020, and there were no observations of impacts in the B-CZ at that location. The relatively low TarGOST® signals at CPT-11-20 and CPT-23-20 coupled with observations in nearby soil borings indicate the extent of the NAPL in the B-CZ/B-TZ is delineated to the northeast.

On-Site - Perimeter of the HWPW Site

TarGOST® locations CPT-12-20 through CPT-21-20 and CPT-56-20 were drilled on-site along the north perimeter of the Site between existing monitoring wells MW-15C and MW-18C (Figure 1) and ranged in total depths from 58 to 62 feet bgs. Refusal was reached at approximately 18 feet bgs at CPT-19-20 and at approximately 25 feet bgs at CPT-20-20 during first attempts. Adjacent locations were cleared, and the CPT/TarGOST® borings were advanced to 58 feet bgs at CPT-19A-20 and 61 feet bgs at CPT-20A-20 before reaching refusal.

TarGOST® locations CPT-24-20 through CPT-27-20 and CPT-54-20 were drilled along the west perimeter of the Site (Figure 1) and ranged in total depths from 32 to 56 feet bgs. Refusal was reached at approximately 37 feet bgs at CPT-24-20 and 31 feet bgs at CPT-27-20 during the first attempts. An adjacent location was cleared, and the rods were advanced to 46 feet bgs at CPT-24A-20 before reaching refusal. A location less than 100 feet south of the original location was cleared, and the CPT rig reached refusal at 32 feet bgs at CPT-27A-20.

Details of TarGOST® signals observed along the northern and western perimeters of the Site are provided below.

Northern Perimeter

Vadose Zone

TarGOST® signals exceeding 20%RE were observed in the vadose zone along the northern perimeter in CPT-12-20, CPT-16-20, CPT-17-20, and CPT-21-20 (Figure 2). The highest TarGOST® signal in the vadose zone along the northern perimeter of the Site was observed at CPT-16-20 approximately 10 feet bgs at 140%RE. The spatial variation of TarGOST® responses within the vadose zone along the northern perimeter of the Site is illustrated in Table C-2 (Attachment C) and on Figure D-6 (Attachment D). TarGOST® signals were greater than 5% within the entire vadose zone interval at CPT-12-20, CPT-13-20, CPT-16-20, and CPT-17-20. Previous CPT-ROST™ borings CPT-18R-95 and CPT-27R-01 located near TarGOST® borings CPT-12-20 and CPT-13-20 (Figure D-6, Attachment D)) did not indicate elevated ROST™ responses in the vadose zone. CPT-ROST™ borings CPT-14R-95 and CPT-16R-95 located near CPT-16-20 and CPT-17-20, respectively (Figure D-6, Attachment D) did indicated ROST™ responses in the vadose zone.

TarGOST® signals were above 5%RE in the vadose zone at the westernmost location CPT-56-20 along the northern perimeter of the Site. Location CPT-56-20 was added after completing CPT-12-20, which indicated elevated TarGOST® signals in the vadose zone. CPT-56-20 TarGOST® signals were detected at about 16%RE

in the vadose zone immediately above the A-TZ at approximately 15.5 feet bgs. However, no observations of NAPL were noted in the vadose zone on soil boring logs for monitoring well MW-15A and MW-15B, located approximately 100 feet west of CPT-56-20, indicating the western extent of potential NAPL in the vadose zone.

TarGOST® boring CPT-21-20 is located at the eastern edge of the line of borings conducted along the northern perimeter of the Site. TarGOST® boring CPT-22-19 is located approximately 320 feet southeast of CPT-21-20. None of the TarGOST® signals at CPT-22-19 were greater than 5%RE in the vadose zone (Table C-3 in Attachment C; Figure D-6 in Attachment D). TarGOST® signals at off-site locations CPT-11-20, CPT-22-19, and CPT-23-20 are less than 5%RE in the vadose zone, providing delineation to the east (Figure 2).

A-TZ

TarGOST® signals in the A-TZ near the north perimeter of the Site exceeded 20%RE at (west to east) CPT-56-20, CPT-12-20, CPT-13-20, CPT-15-20, CPT-16-20, and CPT-21-20 (Figure D-6 in Attachment D) and are described in greater detail below.

- CPT-56-20: TarGOST® signals were elevated within the top A-TZ in a thin interval (approximately 16 to 17.3 feet bgs) at CPT-56-20, with signals exceeding 30%RE.
- CPT-12-20: TarGOST® signals were elevated within the entire A-TZ interval (approximately 14 to 22 feet bgs) at CPT-12-20, with signals exceeding 60 to 90%RE at discrete intervals. The highest TarGOST® response was detected near the base of the A-TZ at 90%RE.
- CPT-13-20: The elevated TarGOST® signals were more variable within the A-TZ interval (approximately 16 to 23 feet bgs) at CPT-13-20 compared to CPT-12-20. TarGOST® signals ranged from greater than 100%RE between 16 and 20 feet bgs, to less than 20%RE between 20 and 22 feet bgs, and increased to over 30%RE near the base of the A-TZ.
- CPT-15-20: TarGOST® signals greater than 30%RE were detected near the base of the A-TZ (approximately 26 feet bgs) at CPT-15-20. TarGOST® signals in the A-TZ above 25 feet bgs were generally less than 6%RE.
- CPT-16-20: TarGOST® signals within the A-TZ (approximately 16 to 26 feet bgs) at CPT-16-20 varied with depth. TarGOST® signals in the upper portion of the A-TZ at CPT-16-20 (16 to 20 feet bgs) ranged from below 10%RE to 20%RE. The maximum TarGOST® signal detected at CPT-16-20 was between 20 and 22 feet bgs at approximately 98%RE. Directly below that interval, TarGOST® signals were below 5%RE. TarGOST® signals increase to over 30%RE near the base of the A-TZ (24 to 26 feet bgs).
- CPT-21-20: A spike in TarGOST® signal was detected near the top of the A-TZ at 20 feet bgs at CPT-21-20. TarGOST® signals below 21 feet bgs were below 5% in the A-TZ (approximately 20 to 31.5 feet bgs).

Comparing to the previous CPT-ROST™ borings along the northern perimeter, CPT-ROST™ boring CPT-18R-95 and CPT-27R-01 located near TarGOST® borings CPT-12-20 and CPT-13-20, respectively, did not indicate elevated ROST™ responses in the A-TZ or upper portions of the A-TZ (Figure D-6 in Attachment D). However, CPT-ROST™ boring CPT-16R-95 located near CPT-17-20 (Figure 1; Figure D-6 in Attachment D) and CPT-ROST™ boring CPT-14R-95 located near CPT-16-20 indicated ROST™ responses within the A-TZ. TarGOST® signals at CPT-14-20 and CPT-15-20, which were located between CPT-13-20 and CPT-16-20, respectively, were mostly below 5%RE in the vadose zone and the A-TZ. Soil borings conducted as part of the TPH-NAPL assessment (discussed in Section 3.0) were drilled and sampled next to TarGOST® borings CPT-12-20 (DPT-12-20) and CPT-16-20 (DPT-16-20). Either visually observed NAPL or strong hydrocarbons odors were noted in the two soil borings (Attachment E). The elevated TarGOST® signals within the top of the A-TZ at CPT-12-20, CPT-13-20, and CPT-16-20 may indicate the presence of light NAPL (LNAPL) in those areas. LNAPL had been

observed in the A-TZ in a temporary well within the HWPW AST Area (SWMU 8) on the northeast side of the Site (PBW, 2010).

As discussed in the RAP Revision 2 (PBW, 2016) and the updated APAR Addendum (PBW, 2010), NAPL had been noted in the A-TZ on boring logs on the north side of the Site at MW-17, MW-72B, MW-57A, and MW-18A (Figure D-6 in Attachment D). DNAPL had historically been observed in well MW-57A, but has not been detected in the well since 2015. Therefore, the TarGOST® signals indicating the potential presence of NAPL in the A-TZ along the northern perimeter are generally consistent with historical soil boring and monitoring well observations except for the TarGOST® signals at CPT-12-20 and CPT-13-20 (Figure D-6 in Attachment D).

The extent of the TarGOST® signals greater than 5%RE in the A-TZ along the northern perimeter of the Site is not delineated to the west based on the results at CPT-56-20 (~30%RE). However, soil boring logs for monitoring wells MW-15A and MW-15B, located approximately 100 feet west of CPT-56-20, had no observations of NAPL noted indicating the western extent of potential NAPL in the A-TZ. In addition, concentrations of COCs in groundwater samples collected from A-TZ well MW-15A have been below detection limits or below applicable PCLs during recent semi-annual sampling events (Golder, 2020). The extent of the TarGOST® signals greater than 5%RE in the A-TZ along the northern perimeter of the Site to the east appears to be delineated. CPT-22-19, located approximately 320 feet southeast of CPT-21-20, had TarGOST® signals less than 5%RE in the A-TZ (Table C-3 (Attachment C); Figure 3) and serves a delineation point to the east. Off-site locations CPT-11-20, CPT-22-19, and CPT-23-20 (Figure 3) indicate that TarGOST® signals are less than 5%RE in the A-TZ, providing delineation to the northeast.

B-CZ/B-TZ

TarGOST® signals exceeding 20%RE were observed in the B-CZ/B-TZ at CPT-12-20 through CPT-21-20 along the northern perimeter. Elevated TarGOST® signals in the B-CZ/B-TZ near CPT-12-20 through CPT-18 -20 were detected in the underlying clay immediately below the A-TZ (generally between 24 and 34 feet bgs). As shown on Table C-2 (Attachment C) and Figure D-6 (Attachment D), elevated TarGOST® signals in the B-CZ/B-TZ were deeper at CPT-19-20 through CPT-21-20 (between 34 and 42 feet bgs) than at CPT-12-20 through CPT-18-20. In addition, elevated TarGOST® signals over 20% were detected between 50 and 56 feet bgs at CPT-20-20 and CPT-21-20. DNAPL had historically been observed in MW-57B near the north side of the Site and NAPL had been noted in the B-CZ/B-TZ on the boring logs of MW-17C, MW-23C, MW-72B, and MW-57B (Figure D-6 in Attachment D). TarGOST® signals indicating the potential presence of NAPL in the B-CZ/B-TZ along the northern perimeter are generally consistent with historical soil boring and monitoring well observations.

The extent of TarGOST® signals greater than 5%RE in the B-CZ/B-TZ along the northern perimeter of the Site is delineated to the west by CPT-56-20 where TarGOST® signals were below 5%RE. TarGOST® boring CPT-22-19 delineates the extent of TarGOST® signals greater than 5%RE in the B-CZ/B-TZ to the east (Figure 4).

West Perimeter

Vadose Zone

Two of the CPT/TarGOST® borings had signals exceeding 5%RE in the vadose zone at CPT-26-20 (5.93%RE approximately 11.6 feet bgs) and at CPT-27-20 (5.38% approximately 14 feet bgs), and none of the TarGOST® signals in the vadose zone exceeded 20%RE (Table C-2 in Attachment C). The signals detected in CPT-26-20 and CPT-27-20 were just slightly above 5%RE and were within one to two feet of the top of the A-TZ. TarGOST® signals at CPT-24-20, CPT24A-20, CPT-25-20, CPT-27A-20, and CPT-54-20 were all below 5% in the vadose

zone. The extent of TarGOST® signals greater than 5%RE in the vadose zone along the west perimeter of the Site is delineated to the south by CPT-27A-20 and to the north by CPT-24-20 and CPT-25-20 and to the west by CPT-54-20 (Figure 2).

A-TZ

On the west side of the Site, TarGOST® signals within the A-TZ were below 5%RE at six of the seven locations. During the first attempt at location CPT-24-20, there were no TarGOST® signals above 5%RE in the A-TZ. Since the boring reached refusal at around 37 feet bgs, the CPT/TarGOST® boring was reattempted. After clearing for utilities, a second attempt was advanced at an adjacent location (CPT-24A-20) less than 10 feet east of the original location to a depth of approximately 46 feet bgs. The TarGOST® signal between 15.5 and 17 feet bgs in the A-TZ sand indicated a ~23%RE response, demonstrating the variability in signals within a relatively small area. Figure 3 includes data collected at CPT-24A-20 to show the maximum TarGOST® signal detected in the area.

The extent of TarGOST® signals greater than 5%RE in the A-TZ is delineated to the south by CPT-25-20, CPT-26-20, CPT-27-20, and CPT-27A-20 and to the west by CPT-54-20. The extent of TarGOST® signals greater than 5%RE is not delineated to the north based on TarGOST® signals at CPT-24A-20 at the top of the A-TZ (approximately 16 feet bgs). However, concentrations of COCs in groundwater samples collected from nearby A-TZ wells, MW-13, MW-95A, and MW-38A, have been below detection limits or multiple orders of magnitude below applicable PCLs during recent semi-annual sampling events presented in the Interim Groundwater Monitoring Report (Golder, 2020). If groundwater was in direct contact with NAPL, concentrations of COCs in groundwater would likely be higher than those observed. No NAPL was noted on the boring logs of MW-13, MW-95A, MW-38A. Monitoring wells MW-13, MW-95A, and MW-38A are all located north and west of CPT-24A-20 (Figure 1 and 3), suggesting that NAPL, if present in the A-TZ, does not likely extend north and west.

B-CZ/B-TZ

During the first attempt at location CPT-27-20, TarGOST® signals above 20%RE in the B-CZ/B-TZ were detected between approximately 26 and 27 feet bgs ranging from ~29 to 34%RE (Table C-2 (Attachment C)). Since the boring reached refusal at around 32 feet bgs, the CPT-TarGOST® boring was reattempted at CPT-27A-20 less than 100 feet south of the original location. Refusal was reached at the second location at approximately the same depth (32 feet bgs). A TarGOST® signal of approximately 7%RE was detected near 32 feet bgs at CPT-27A-20. Both sets of data were used to contour the %RE responses for the B-CZ/B-TZ (Figure 4).

On the west side of the Site, DNAPL has been observed in two monitoring wells MW-12B and MW-41B with some of the thickest in-well measurements of DNAPL observed at the Site (MW-12B with >20 feet thick and MW-41B with >6 feet thick in October 2019). The TarGOST® response observed in CPT-27-20 was a few feet above the screened interval of MW-41B, located approximately 50 feet north of CPT-27-20. Monitoring well P-11 is located within 30 feet northeast of CPT-27A-20; and no DNAPL has been observed in P-11. CPT-54-20 was advanced 150 feet west of CPT-27-20 and CPT-27A-20, but also reached refusal at about 32 feet bgs. No TarGOST® signals above 5%RE were detected at CPT-54-20 (Table C-2 (Attachment C)). The extent of TarGOST® signals greater than 5%RE in the B-CZ/B-TZ along the western perimeter of the Site is delineated to the north and west by CPT-26-20 and CPT-54-20, respectively, where TarGOST® signals were below 5% in the B-CZ/B-TZ. The extent of TarGOST® signals greater than 5%RE was not delineated in the B-CZ/B-TZ to the south based on the CPT-27A-20 signals. However, COC concentrations in groundwater samples from P-11, as well as monitoring well P-12 located southeast of CPT-27A-20, have been below detection limits or multiple orders of magnitude

below applicable PCLs during previous semi-annual sampling events (Golder, 2020), suggesting that NAPL likely does not extend south of CPT-27A-20

Although, as noted above, significant in-well DNAPL thickness measurements have been observed in monitoring wells MW-12B and MW-41B, TarGOST® signals in the B-CZ/B-TZ depth interval from all but two CPT borings in this vicinity (CPT-27-20 and CPT-27A-20) were less than 5%RE. In addition, of the 13 CPT/ROST™ locations previously advanced within a 200 ft radius of MW-12B and of MW-41B, one location (CPT-19R-01) had a ROST™ response that indicated the presence of NAPL in the B-TZ/B-CZ (PBW, 2014). These data, coupled with COC concentrations below applicable PCLs (Golder, 2020) and the absence of measurable DNAPL in the six other B-CZ/B-TZ monitoring wells in this vicinity (MW-39B, MW-38B, MW-62B, P-11, and MW-42B), suggest a very localized NAPL in this unit within this area.

Englewood Intermodal Yard

The NAPL assessment conducted in the Englewood Intermodal (IM) Yard consisted of 21 CPT/TarGOST® borings conducted throughout the north and east portions of the Englewood IM Yard (Figure 1). The objective of the assessment was to evaluate the extent of NAPL in the Englewood IM Yard. CPT/TarGOST® locations CPT-28-19 through CPT-46-19 and CPT-55-19 ranged in depth between 23 and 65 feet bgs. CPT/TarGOST® location CPT-37-19 reached refusal at approximately 10 feet bgs. Because of concerns of potential underground utilities in the area, this location was not re-drilled. General observations from the CPT-TarGOST® signals for each zone are provided below.

Vadose Zone

TarGOST® signals above 20%RE were detected in the vadose zone in CPT-29-19, CPT-30-19, CPT-32-19, CPT-35-19, and CPT-42-19 (Figure 2 and Table C-3 (Attachment C)). TarGOST® borings CPT-29-19, CPT-30-19, CPT-31-19, CPT-32-19, and CPT-35-19 are located within the former lagoon area identified on historical aerials and maps of the Englewood IM Yard. CPT-42-19 is located in the area of the former ASTs. TarGOST® signals in the Englewood IM Yard are delineated to 5%RE to the east by CPT-46-19, CPT-45-19, and CPT-41-19, to the south by CPT-40-19, CPT-36-19, CPT-38-19, CPT-55-19, and to the west by CPT-28-19. As discussed in the RAP Revision 0 (PBW, 2014), previous ROST™ borings and soil borings conducted in the HWPW area indicated the presence of NAPL in the vadose zone extending from the HWPW Site into the Englewood IM Yard. Therefore, the extent of the TarGOST® signals above 5%RE to the north likely extend to the north perimeter.

A-TZ

TarGOST® signals greater than 20% were detected in the A-TZ (Figure 3 and Table C-3 (Attachment C)) at the following locations:

- CPT-30-19: The highest TarGOST® signals (>100%RE) within the A-TZ at CPT-30-19 were detected between 18 to 20 feet bgs near the top of the A-TZ. TarGOST® signals decreased with depth within the A-TZ.
- CPT-31-19: The highest TarGOST® signals (>800%RE) within the A-TZ at CPT-31-19 were detected between 24 and 26 feet bgs near the base of the A-TZ. TarGOST® signals near the top of the A-TZ (18 to 20 feet bgs) were also elevated (approximately 93%RE). TarGOST® signals in an interval between 20 and 23 feet bgs in the middle of the A-TZ were below 5%.

- CPT-32-19: TarGOST® signals within the A-TZ at CPT-32-19 ranged from ~17%RE to approximately >200%RE. The highest TarGOST® signals within the A-TZ at CPT-32-19 were near the base of the A-TZ approximately 25 feet bgs.
- CPT-36-19: TarGOST® signals within the A-TZ at CPT-36-19 ranged from below 5%RE to approximately 115%RE, near the base of the A-TZ. between 23 and 24 feet bgs. TarGOST® signals above 23 feet bgs were below 5%. DNAPL has been observed in nearby monitoring well MW-78A (Figure 3). DNAPL thickness at MW-78A has ranged from less than 1 foot to over 3 feet in the 1st quarter of 2020.
- CPT-46-19: The highest TarGOST® signals (~>570%RE) within the A-TZ at CPT-46-19 were detected between 22 and 24 feet bgs near the base of the A-TZ. TarGOST® signals above 23 feet bgs were below 5%RE. MW-49A is located near CPT-46-19 (Figure 3) and is screened from 20 to 30 feet bgs. No in-well DNAPL has been observed at MW-49A since installation in 2007.

The extent of TarGOST® signals greater than 5%RE in the A-TZ are delineated by the following locations where the TarGOST® signals were below 5%RE in the A-TZ to the west by CPT-28-19 and CPT-34-19, to the east by CPT-48-19 and CPT-22-19, and to the south by CPT-38-19, CPT-39-19, CPT-40-19, and CPT-41-19 (Figure 3). . The northern extent of elevated TarGOST® signals in the A-TZ is assumed to extend to the north perimeter of the HWPW.

B-CZ/B-TZ

The highest TarGOST® signals at the Site were detected in B-CZ/B-TZ in the Englewood IM Yard (Figure 4 and Table C-3 (Attachment C)). Intervals within the B-CZ/B-TZ with TarGOST® signals >20%RE were detected at the following locations:

- CPT-29-19: TarGOST® signals were greater than 20%RE between 40 and 47 feet bgs and between 50 and 52 feet bgs. The highest signals in the B-CZ/B-TZ at CPT-29-19 were detected between 43 and 44 feet bgs at 325%RE.
- CPT-30-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to 36 feet bgs, between 40 and 44 feet bgs, and between 50 and 56 feet bgs. The highest signals in the B-CZ/B-TZ at CPT-30-19 were detected between 52 and 53 feet bgs at 813%RE.
- CPT-31-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 35 feet bgs and between 40 and 45 feet bgs. From 24 feet bgs to 34 feet bgs, the maximum TarGOST® signals ranged from ~690 to 987%RE. A TarGOST® signal of ~813%RE was detected around 40 feet bgs.
- CPT-32-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 40 feet bgs. The highest TarGOST® signals within that interval were detected at about 1,298%RE at the base of the A-TZ at approximately 25 feet bgs (Table C-3 (Attachment C)). As shown on Figure 4, the highest TarGOST® response in the B-CZ/B-TZ detected on-site was at CPT-32-19. MW-74B is located within 20 feet of CPT-32-19 and NAPL was noted on the boring log of MW-74B at 23.5 to 24.3 feet bgs, 25.8 to 26.1 feet bgs, and 29 to 35 feet bgs along fractures in a sandy clay. MW-74B is screened from 25.5 to 36.5 feet bgs (Figure D-5 in Attachment D). However, no in-well DNAPL has been observed in this well since installation in 2011.
- CPT-35-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 35 feet bgs and between 41 and 50 feet bgs. The highest signals in the B-CZ/B-TZ at CPT-35-19 were detected between 43 and 48 feet bgs as high as 926%RE.

- CPT-36-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 35 feet bgs. the highest TarGOST® signal was detected at ~873%RE at a depth of approximately 24.5 feet bgs.
- CPT-39-19: TarGOST® signals were greater than 20%RE between 25 and 34 feet bgs, between 40 and 43 feet bgs, and near 50 feet bgs and 57 feet bgs. The highest signals at about 406%RE were detected at approximately 40 feet bgs.
- CPT-40A-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 42 feet bgs. Elevated signals were detected between 26 and 40 feet bgs ranging from 200 to over 895%RE.
- CPT-41-19: TarGOST® signals were greater than 20%RE between 26 and 32 feet bgs and at 37 feet bgs. The highest signals at CPT-41-19 (~60%RE) were detected at approximately 37 feet bgs. Monitoring well MW-75B is located less than 200 feet south of CPT-41-19 and west of CPT-44-19 and is screened from 32.3 to 37.2 feet bgs (Figure 4). DNAPL thickness in MW-75B has ranged from not detected to over 2 feet in the first quarter of 2020. NAPL was noted at 36.4 to 36.8 feet bgs on the boring log of MW-75B during installation in 2011.
- CPT-44-19: TarGOST® signals were greater than 20%RE between 32 and 34 feet bgs at a maximum signal of 22.2%RE.
- CPT-45-19: TarGOST® signals were greater than 20%RE between 31 and 34 feet bgs and between 38 and 40 feet bgs. The highest signals were detected at approximately 39 feet bgs at approximately 73%RE.
- CPT-46-19: TarGOST® signals were greater than 20%RE from the base of the A-TZ to approximately 38 feet bgs. The highest signals were detected at the top of the B-CZ (approximately 435%RE) (Table C-3, Attachment C). Monitoring well MW-49B is located within 30 feet of CPT-46-19 and screened from 30 to 35 feet bgs (Figure 4). DNAPL thickness in MW-49B has ranged from over 5 feet to over 13 feet during the 1st quarter of 2020.

Locations with TarGOST® signals above 100%RE are mainly in the areas of the former ASTs and former lagoons identified on historical aerials and maps in the IM Yard (Figure 4).

The extent of NAPL in the B-CZ/B-TZ is delineated by the following locations where the TarGOST® signals were below 5%RE across the B-CZ/B-TZ: to the west by CPT-28-19, to the east by CPT-22-19, CPT-43-19, CPT-48-19, and to the south by CPT-55-19 and CPT-42-19 (Figure 4).

2.3.2 Variability in TarGOST® Waveforms

The TarGOST® system logs the wavelength light emitted (fluorescence) of the soil after it is exposed to laser excitation light. The light is converted into electrical current pulses that are transformed into digitized transient voltage signals (waveforms). Waveforms from selected depths are called out on the left side of the TarGOST® logs. Four different wavelength bands are represented by different peaks and colors within the waveform call-out. The width of the peaks represents the lifetime of the fluorescence. Dakota produces cluster diagrams (wavelength vs lifetime) to aid in the identification of differences in waveforms between logs or within a single log. Cluster diagrams for TarGOST® borings conducted in 2019 and 2020 are provided in Appendix A of Attachment A.

Variability in TarGOST® waveforms (fluorescence signatures) may occur due to natural weathering/depletion processes, NAPL source material mixing or co-mingling, soil matrix differences, and NAPL compositional differences (Dakota, 2020; Attachment A). After review of the TarGOST® data collected from the Site, Dakota identified the following two waveforms that dominate the data set:

- Waveform #1: Logs that exhibit waveform #1 include the tar-like material from the seeps in the Englewood IM Yard - CPT-12-20, CPT-24A-20, CPT-30-19, CPT-35-19, and CPT-36-19.
- Waveform #2: Waveform #2 mainly differs from waveform #1 due to a slight increase in lifetime of fluorescence (shift up to row 2 from row 1 on cluster diagrams). Logs that exhibit waveform #2 include CPT-27-19, CPT-39-19, CPT-40A-19, CPT-45-19, CPT-46-19.
- The two waveforms are similar and appear closely related and are often seen within the same logs (Dakota, 2020). Logs that exhibit both waveforms include CPT-29-19, CPT-30-19, and CPT-32-19, which are located near the former lagoon areas within the Englewood IM Yard.

Both waveforms were observed throughout the Site. According to Dakota, the different waveforms are likely a result of subtle chemistry differences within the same basic NAPL. However, the origin of these differences is unknown (Dakota, 2020; Attachment A).

The waveforms observed in the vadose zone at CPT-42-19 and CPT-17-20 are different than the waveforms observed in the majority of other logs at the Site. Dakota indicated that the material associated with the waveforms at these locations is likely a lighter NAPL such as diesel (Dakota, 2020, Attachment A). CPT-17-20 was advanced near the former process areas on the HWPW site. CPT-42-19 was advanced in the area of former ASTs in the Englewood IM Yard. Soil samples were collected above the saturated zone at CPT-42-19 and are discussed in Section 3.0.

2.4 Limitations

TarGOST® specifically targets the PAHs found in creosote NAPLs and DNAPLs and does not respond to typical lighter end fuels like gasoline or kerosene unless co-mingled with creosote (Dakota, 2020, Attachment A). As discussed in Section 3.0, some areas in the Englewood Intermodal Yard may have soil impacted by releases of other types of fuel. Thinner, less viscous NAPLs (oil-like material) typically fluoresce at different wavelengths compared to the more viscous tar-like material, which may partially explain the differences in signal that is seen across the Site within the same GWBUs. In addition, soil matrices affect fluorescence. Sands and gravels may have as much as 10 times higher response than clays and silts, which may explain some of the differences in response observed within each log between GWBUs (sandy A-TZ vs the silty clayey B-CZ/B-TZ).

Limestone gravel fill, calcareous sands, buried wood/debris, shell hash, and other materials may result in false positives (Dakota, 2020; Attachment A). Beds of calcareous nodules are common within the B-CZ/B-TZ, especially on the east side of the Site, which was taken into consideration when reviewing the TarGOST® data. Additional limitations are discussed in the Dakota Report in Attachment A.

2.5 NAPL Assessment Conclusions

Since 1995, site investigations, including CPT/ROST™ investigations, were conducted to evaluate surface and subsurface soils for the presence of NAPL. To refine the observed subsurface distribution of DNAPL at the Site, CPT/TarGOST® data were collected in 2019 and 2020. Conclusions are summarized by the areas that were evaluated during the 2019/2020 NAPL Assessment activities (off-site, northern and western perimeter of the HWPW Site, and Englewood Intermodal Yard):

<u>Off-Site</u>

TarGOST® signals in the vadose zone and the A-TZ north of Liberty Road and north of the Site were below 5%RE. Based on a combination of observations made in boring logs, previously collected ROST™ data, and the CPT/TarGOST® data, there is no evidence of off-site NAPL present within the vadose zone or the A-TZ.

For the B-CZ/B-TZ, elevated TarGOST® signals greater than 20%RE in this zone off-site generally corresponds with observations of NAPL in wells, boring logs, and previously collected data. Based on the additional NAPL assessment activities, the extent of NAPL in the B-CZ/B-TZ off-site is 24 feet or deeper and delineated to within approximately 500 feet north of the Site.

On-Site (Northern Perimeter)

TarGOST® signals indicating the potential presence of NAPL in the vadose zone and the A-TZ along the northern perimeter are consistent with historical observations, except at CPT-12-20 and CPT-13-20. Previous CPT-ROST™ borings had not identified elevated ROST™ responses in the vadose zone and A-TZ near TarGOST® borings CPT-12-20 and CPT-13-20. The extent of the potential presence of NAPL in the vadose zone and A-TZ along the northern perimeter is delineated to the west and east by a combination of TarGOST® signals and observations on soil boring logs.

TarGOST® signals indicating the potential presence of NAPL in the B-CZ/B-TZ along the northern perimeter are consistent with historical observations. The extent of TarGOST® signals greater than 5%RE in the B-CZ/B-TZ along the northern perimeter is delineated to the west and east by TarGOST® borings CPT-56-20 and CPT-22-19, respectively.

On-Site (West Perimeter)

TarGOST® signals in the vadose zone along the west perimeter on-site were slightly above 5%RE at CPT-26-20 and CPT-27-20. The extent of TarGOST® signals greater than 5%RE in the vadose zone is delineated to the south by CPT-27A-20 and to the north by CPT-24-20 and to the west by CPT-54-20. None of the TarGOST® borings had %RE signals significantly above 5%RE along the west perimeter, except at CPT-24A-20. A TarGOST® signal between 15.5 and 17 feet bgs at CPT-24A-20 indicated an approximate 23%RE response. TarGOST® signals at CPT-24-20, an adjacent location less than 10 feet from CPT-24A-20, were all below 5%RE, demonstrating the variability in signals within a relatively small area. The extent of TarGOST® signals indicating potential NAPL, if present in the A-TZ, is delineated to the south by CPT-25-20, CPT-26-20, CPT-27-20, and CPT-27A-20, to the west by CPT-54-20, and to the northwest based on observations in soil borings and groundwater sampling data.

Significant in-well DNAPL thickness measurements have been observed in B-CZ/B-TZ monitoring wells MW-12B and MW-41B. However, TarGOST® signals from all but two CPT borings in this vicinity (CPT-27-20 and CPT-27A-20) were less than 5% in the B-CZ/B-TZ. These data, coupled with the absence of measurable DNAPL in the nearby B-CZ/B-TZ monitoring wells (MW-39B, MW-38B, MW-62B, P-11, and MW-42B), suggest a very localized NAPL in this unit within this area of the Site.

Englewood Intermodal Yard

TarGOST® signals above 20%RE were detected in the vadose zone at locations within the former lagoon area identified on historical aerials and maps of the Englewood IM Yard. TarGOST® signals above 20%RE were also detected in the vadose zone at CPT-42-19, which is located in the former ASTs area. Elevated TarGOST® signals were detected in the A-TZ also within the former lagoon area with maximum %RE signals ranging from 115%RE (CPT-36-19) to 839%RE (CPT-31-19). TarGOST® boring CPT-46-19, located east of the former AST area had a signal of 570%RE at the base of the A-TZ.

The highest TarGOST® signals at the Site were detected in the B-CZ/B-TZ in the Englewood IM Yard. Locations with TarGOST® signals above 100%RE were mainly in the former ASTs and former lagoon areas identified on historical aerials and maps, with six TarGOST® locations having signals greater than 800%RE (maximum signal of 1,298%RE at CPT-32-19). Elevated TarGOST® signals were also detected in the B-CZ/B-TZ on the east side of the Englewood IM Yard east of the former AST area at CPT-46-19 (maximum of 435%RE)).

The highest TarGOST® signals detected, 1,298%RE at CPT-32-19, was observed at the base of the A-TZ or top of the B-CZ at approximately 25 feet bgs. DNAPL recovery well MW-74B is located within 20 feet of CPT-32-19 and is screened from 25.5 to 36.5 feet bgs. During well installation, NAPL was noted on the boring log for MW-74B at intervals between 23.5 to 35 feet bgs along fractures in a sandy clay. However, since installation in 2011, no DNAPL has been observed in this well.

In contrast, monitoring well MW-49B, located within 30 feet of CPT-46-19 where TarGOST® signals range from 102%RE to 435%RE, has had DNAPL detected in the well. Also, monitoring well MW-75B, located less than 200 feet from CPT-41-19 where a maximum signal of 61%RE approximately 37 feet bgs was observed, has had DNAPL routinely detected in the well. Monitoring well MW-75B is screened from 32.3 to 37.2 feet bgs, and NAPL was noted at 36.4 to 36.8 feet bgs on the boring log of MW-75B during installation in 2011. Both MW-49B and MW-75B are part of the DNAPL Recovery Well network.

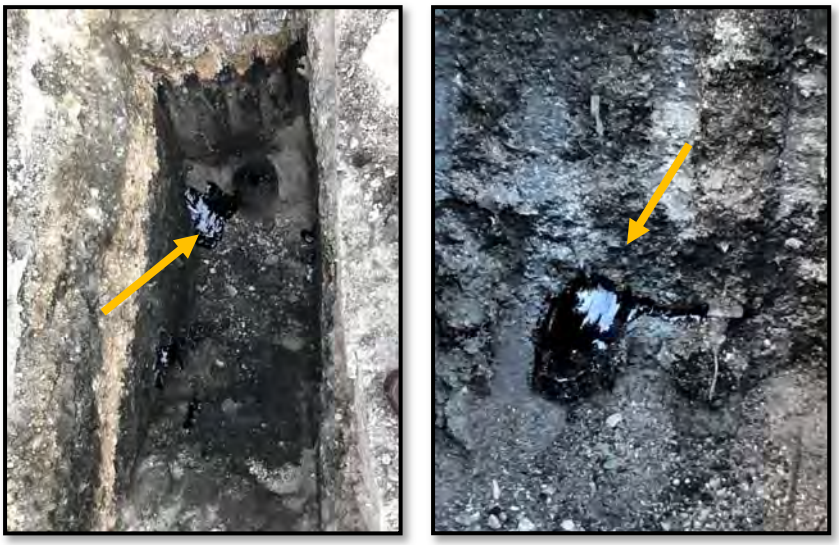
For the Englewood IM Yard, the extent of TarGOST® signals greater than 5%RE in the vadose zone, A-TZ, and B-CZ/B-TZ are delineated to the west, south, and east. The northern extent of elevated TarGOST® signals in the three zones is assumed to extend to the north perimeter of the HWPW.

3.0 TPH-NAPL ASSESSMENT

The objective of the TPH-NAPL assessment was to preliminarily identify potential TPH-NAPL sources within the Englewood IM Yard and evaluate the lateral extent of TPH in soils at the Site. Details on the background, assessment methods, data evaluation, and conclusions are provided in the following sections.

3.1 Background

During the July 2017 quarterly inspection of the capped areas, a tar-like NAPL was observed surfacing within the Englewood IM Yard through the joints and cracks in the concrete and asphalt surfaces primarily in the area shown on Figure 6. In October 2018, Golder personnel documented the excavation of four test pits in the areas where the tar-like NAPL was observed in the Englewood IM Yard, as detailed in the *Monthly Status Update – Soil Cap and Concrete Cap Repairs* dated October 31, 2018 (October 2018 Monthly Update) submitted to the TCEQ (Golder, 2018). The NAPL observed in each test pit visually appeared to be similar at each location and was described as a black, viscous material found within the top 3 feet bgs. Photographs of one of the test pits is provided below.



View of Test Pit B100, note paste-like NAPL seeping in around 3 feet bgs

As part of that test pit evaluation, samples of the tar-like NAPL were collected and analyzed for total petroleum hydrocarbons (TPH) by TX1005 Method, TPH fractionation by TX1006 Method, volatile organic compounds (VOCs) by EPA Method 8260, semi-volatile organic compounds (SVOCS) by EPA Method 8270, and reactivity/ignitability/corrosivity for waste profiling. The four NAPL samples had TPH concentrations ranging from 23,000 mg/kg to 35,000 mg/kg, with the highest concentrations detected in the C_{12}-C_{28} TPH range. Each NAPL sample was also analyzed for TPH fractionation by TX1006 Method. As detailed in the October 2018 Monthly Update (Golder, 2018), the four NAPL samples collected from the test pits appeared to have a similar distribution of TPH fractions. A Tier 1 PCL for Total TPH was established using the TCEQ Tier 1 TPH PCL Calculator (v 2.0 – 12/2016) and the TPH fractionation data collected from the test pits. The 30-Acre C/I Tier 1 $^{Tot}Soil_{Comb}$ PCL of 46,900 mg/kg was established as the appropriate Tier 1 PCL since the TPH concentration is considered protective of the underlying groundwater. None of the NAPL samples themselves had total TPH concentrations greater than the calculated TPH PCL.

Based on the results of the test pit evaluation, Golder, on behalf of UPPR, proposed a NAPL Collection System design as an interim measure as detailed in the October 2018 Monthly Update. The TCEQ approved UPRR to proceed with the interim measure in a letter dated December 6, 2018, with additional comments on the NAPL TPH assessment and requested UPRR submit a schedule "to assess and characterize the extent of environmental media affected with TPH and identify the TPH source area(s)". Golder, on behalf of UPRR, prepared a response letter dated January 9, 2019 (Golder, 2019b) that provided the following information on possible TPH source areas:

- *Based on the analytical data for the tar-like substance (NAPL) and surrounding soils, the NAPL does not appear to be creosote. As discussed in the email from Golder to the TCEQ on October 22, 2018, the specific source of the tar-like substance or NAPL is uncertain. However, historical aerials (see attached Fig XI-A-1d from the RCRA permit renewal showing the 1943 aerial (Attachment C)) indicate two lagoons or ponds in the area of the present-day Englewood Intermodal Yard. Adjacent to the lagoons were three, large, above ground storage tanks (ASTs) that were used for storage of crude oil with an estimated capacity of 55,000 barrels each (based on the description on the 1929 Sanborn Map (Attachment C)). The NAPL appears to be a heavily weathered petroleum hydrocarbon, likely from releases from the ASTs.*

The soil and groundwater within the Englewood Intermodal Yard have been extensively investigated over the past 10 years. As discussed in the Response Action Plan (RAP) (Attachment 1A, PBW, November 2014), PBW conducted a soil, groundwater, and cone penetrometer with rapid optical screening tool (CPT/ROST™) investigation in 2013 focused in the Englewood Intermodal Yard area to evaluate the lateral and vertical extent of COCs above TRRP PCLs in soils and preliminarily evaluate the presence of NAPL in the subsurface. The investigation specifically targeted the former AST and lagoon area. The ROST™ data from the investigation was incorporated into the site-wide ROST™ data and presented on Figure 4D – Vadose Zone NAPL Observation and ROST™ Reading (attached under Attachment D) presented in the RAP (November 2014). Additional soil sampling was conducted within the Englewood Intermodal Yard in May 2018 as part of a pavement improvement project where soils beneath the pavement were characterized prior to construction.

Following the TCEQ's review of the January 9, 2019 response letter, the TCEQ issued a Request for Information comment letter dated February 6, 2019 requesting UPRR to delineate the TPH impacted soils horizontally and vertically in accordance with 30 Texas Administrative Code (TAC) 350.51. Golder, on behalf of UPRR, prepared a response letter dated February 28, 2019 detailing a proposed soil assessment for TPH in and around the Englewood IM Yard, specifically in the areas where the former lagoon and ASTs were assumed to be located. The response letter provided proposed soil boring locations for the TPH assessment and a preliminary schedule, pending TCEQ approval, to address the TCEQ comments. The TCEQ did not issue a follow-up letter, but rather incorporated the February 6, 2019 request for the TPH Assessment into the Technical Notice of Deficiency (TNOD) dated April 11, 2019 , which stated *"the current assessment of the total petroleum hydrocarbon – non-aqueous phase liquid (TPH-NAPL) seep source(s) and extent is insufficient because only a limited soil assessment was performed. Additional soil and groundwater assessments is needed which shall include additional soil borings, well installation and monitoring. Additional assessment is discussed in more detail in comment nos. T35(4), T42(4), T43(3), T44(4), T45(4) and T48(3)."*

Under a cover letter dated July 10, 2019, UPRR submitted a response to the TCEQ TNOD that included the Conceptual Response Action Plan (RAP) dated July 9, 2019 detailing pre-design assessment activities including the proposed *TPH-NAPL Assessment Englewood Intermodal Yard* (Golder, 2019a). The TCEQ issued a letter dated September 6, 2019 detailing additional comments on UPRR's July 10, 2019 Response to the TNOD. The TCEQ's comments on the proposed pre-design TPH-NAPL assessment, included a request for specific additional sample locations. A meeting was held on September 23, 2019 at the TCEQ Austin office between UPRR, TCEQ, and Golder to discuss the requested additional assessment activities. Golder, on behalf of UPRR, then submitted a response letter dated October 23, 2019 confirming the additional TPH assessment locations based on the discussions with the TCEQ on September 23, 2019. The TCEQ issued a letter dated December 13, 2019 providing approval for UPRR to proceed with the TPH-NAPL pre-design assessment activities as revised in the October 23, 2019 letter.

Details of the assessment methods and results are provided in the following sections.

3.2 Assessment Methods

Following TCEQ approval and between December 2019 and February 2020, 56 soil samples from 28 soil borings were collected for TPH analysis to delineate the horizontal and vertical extent of TPH concentrations in soils as described in the October 23, 2019 letter. The soil boring locations are shown on Figure 5. Soil borings were

advanced using a hand auger and a track-mounted Geoprobe® DPT rig. To clear the borings of underground utilities, the top 5 to 8 feet of the soil borings were advanced using a hand auger.

Soil borings were drilled to the top of the uppermost GWBU (A-TZ) to assess the surface and subsurface soils at each location. Soil samples were collected continuously for the total depth of each boring and logged by field personnel and field screened using a photoionization detector (PID). Boring logs are provided in Attachment E. Following the collection of soil samples, the soil borings were plugged with bentonite grout. Soil samples were collected in laboratory-supplied containers and placed on wet ice in an insulated cooler. A chain-of-custody record accompanied the samples through receipt at ALS Environmental Laboratory in Houston, Texas.

Based on field observations and lithology, soil samples selected for analysis were collected from 1-foot sub-intervals from each soil boring from within the 0 to 5-foot and the 5-foot to top of the A-TZ depth intervals. Soil samples were analyzed for TPH by Method TX1005. Gas chromatography (GC) graphs from the samples with the highest TPH concentrations were compared to evaluate whether the general hydrocarbon composition of the TPH differed across the sampled areas. Samples with elevated TPH concentrations and different compositional distributions based on the TX1005 results were selected for Method TX1006 analyses to develop site-specific TPH mixture critical PCLs following the TCEQ Guidance Document RG- 366/TRRP-27 (TCEQ, 2010a).

Analytical data from the soil samples collected during the TPH-NAPL assessment were reviewed for adherence to established quality assurance/quality control (QA/QC) criteria, and Data Usability Summary (DUS) was prepared in accordance with TCEQ publication RG-366/TRRP-13 (TCEQ, 2010b) to demonstrate the quality of the laboratory analytical data and present any deviations from the established QA/QC criteria. Copies of the analytical data reports and the DUS are provided in Attachment F.

3.3 Data Evaluation

The TPH data evaluation included the following:

1. Evaluate the lateral extent of the TPH concentrations in soils using the TX1005 analytical data compared to applicable TCEQ TRRP PCLs.
2. Evaluate hydrocarbon types by reviewing the GC chromatograms from the samples with the highest TPH TX1005 concentrations to assess whether the general hydrocarbon composition of the TPH differed across the sampled areas.
3. Samples with elevated TPH concentrations and different compositional distributions based on the TX1005 results were selected for TX1006 analyses. The results from the TPH fractionation by Method TX1006 were used to develop TPH Mixture critical PCLs for each hydrocarbon type using the TCEQ TRRP Tier 1 TPH PCL Calculator (v 3.0 – 02/2020).
4. The TPH soil PCL Exceedance (PCLE) Zone was then established using the individual TPH Mixture cPCLs.

Discussion on delineation of the TPH concentrations in soils, different hydrocarbon types identified, establishing critical PCLs for the TPH, and TPH soil PCLE Zone are provided in the following sections.

3.3.1 TPH TX 1005 Evaluation

The TPH soil data evaluation followed a “focused on-site soil assessment” as detailed in the TCEQ Guidance Document Affected Property Assessment Requirements under TRRP, RG-366/TRRP-12, Revised May 2010 (TCEQ, 2010c) and 30 TAC §350.51(c), which states “*for soils only, the person can focus the horizontal on-site assessment to define the area exceeding the applicable critical PCL (i.e., residential or commercial/industrial).*”

Therefore, for the purposes of assessing the lateral extent of TPH TX1005 analytical results in soils, the TPH data were initially compared to the following PCLs based on the location of the soil boring:

- Along the perimeter of the Site, soil samples were compared to the Tier 2, residential, 30-acre source area PCLs; or
- Within the interior of the Site, soil samples were compared to the Tier 2, Commercial/Industrial, 30-acre source area PCLs.

A summary of the soil TPH results by TX1005 compared to the applicable PCL based on the location of the soil samples is provided in Table 1 and shown on Figure 6.

Based on the soil TPH TX1005 data, the TPH concentrations were delineated to the applicable TPH TX1005 PCLs at the western perimeter of the Site to the east, south, and west except at location DPT-26-20 (on the western perimeter), which had a TPH C_{12}-C_{28} concentration of 3,300 mg/kg that exceeded the residential PCL of 1,500 mg/kg, but was less than the commercial/industrial PCL of 4,400 mg/kg. Another soil boring, DPT-24-20 located on the west perimeter north of DPT-26-20 had TPH concentrations less than the residential PCLs. The three soil borings along the northern perimeter, DPT-12-20, DPT-16-20, and DPT-21-20 each had TPH concentrations in the C_6-C_{12} and C_{12}-C_{28} ranges that exceeded the residential PCLs. Of those samples, one had a TPH concentration that exceeded the commercial/industrial PCL (DPT-12-20 from 8-9 feet bgs, C_{12}-C_{28} range).

Soil samples were collected from depth intervals corresponding to potential surface and subsurface soil pathways under TRRP to evaluate TPH concentrations vertically to the appropriate PCL, rather than to the higher of the method quantitation level (MQL) or background. For the perimeter locations, the deeper soil samples collected from DPT-12-20 (8-9 feet bgs), DPT-16-20 (14-15 feet bgs), and DPT-26-20 (13-14 feet bgs) had concentrations detected above the MQL. The following TRRP Rule for the vertical delineation was followed: 30 TAC 350.51(d)(4): *If a person has already determined that the groundwater is impacted, then they may satisfy the requirements of this subsection by declaring the entire soil column to the top of the lowest impacted groundwater bearing unit as a soil PCLE zone.* Since the TPH soil boring locations are generally within the groundwater PCLE zones for the three GWBUs (a cumulative groundwater PCLE shown on Figure 5 using the information provided in the Interim Groundwater Monitoring Report (Golder, 2020)), the entire soil column is considered part of the affected property. The only soil boring location that appears to be outside the groundwater PCLE zones is DPT-42-19, but is likely within the overall groundwater affected property.

As part of the NAPL assessment within the Englewood Intermodal Yard, the total TPH TX1005 concentrations in soil samples collected within the vadose zone were also compared to the TCEQ theoretical residual soil saturation limit (Tier 1 $Soil_{Res}$) PCL (10,000 mg/kg) as a possible further preliminary indication of the potential presence of NAPL. Soil borings with at least one soil sample containing TPH TX1005 concentrations above the Tier 1 $Soil_{Res}$ include seven locations in the general area of the former lagoons (DPT-30-19, DPT-32-19, DPT-34-19, DPT-35-19, DPT-36-19, DPT-37-19, and DPT-38-19) and one location within the area of the former ASTs (DPT-42-19) (Table 1; Figure 5). At each of these locations where TPH concentrations were detected greater than 10,000 mg/kg, either NAPL was visually observed or strong hydrocarbon odors were noted on the soil boring logs (Attachment E).

The soil TPH TX1005 results are delineated to less than the Tier 1 $Soil_{Res}$ PCL to the north, south, east, and west (Figure 5). The area where the soil samples indicate TPH concentrations greater than the Tier 1 $Soil_{Res}$ PCL is generally within the TarGOST® 5%RE contour within the vadose zone in the Englewood Intermodal Yard (Figure 2), except at DPT-36-19 and DPT-38-19 that had TarGOST® signals less than 5%RE in the vadose zone. Based

on the samples collected as part of this assessment, total TPH concentrations detected above 10,000 mg/kg are typically found in the top six feet bgs. Since the top 8 to 10 feet of soils were cleared for potential utilities for the CPT/TarGOST® borings and backfilled with sand, the TarGOST® signals would not have detected the potential NAPL in the shallow portion of the vadose zone where these TPH concentrations were detected.

The information gathered from the TPH-NAPL assessment in combination with the data from the test pits will be used to develop the NAPL response triggers for the TPH-NAPL area in the Englewood Intermodal Yard following the TCEQ Risk-Based NAPL Management Guidance Document (RG-366/TRRP-32) (TCEQ, 2013). The NAPL response triggers and resulting response action objectives will be detailed in the Revised RAP.

3.3.2 Hydrocarbon Types

GC chromatograms for the TPH TX1005 soil samples collected in 2020 and the associated TPH fractionation data by TX1006 for selected samples were evaluated to provide an interpretation of the hydrocarbon types present in the soil samples. A summary of the soil TPH results by TX1006 is provided in Table 2. A technical memorandum prepared by a Golder chemist summarizing the interpretation of the soil data is provided in Attachment G. Based on the profile of the predominant peaks in the chromatograms and the fractionation data, the TPH results for the soil samples were assigned four categories, which may indicate different TPH types:

- nC_6 to nC_{12} Organics – GC graphs indicate the presence of VOCs;
- $>nC_{12}$ to nC_{28} Organics – appears to be impacted by diesel or other fuels of similar composition.
- $>nC_{12}$ to nC_{28} Organics with High Aromatic Content and low VOC content – typical for creosote; and
- Unresolved complex material (UCM) – potentially may include residual fuel oils (which have common names such as No. 4, 5, and 6 fuel oils) and bunker C or asphalt and lubricating oils.

GC graphs of samples with TPH concentrations below the detection limit or relatively low concentrations (<100 mg/kg) were not included in the hydrocarbon type analysis.

Soil samples falling into each category are listed in Tables 1 through 4 of the technical memorandum in Attachment G and color coded as shown on Figure 6. The general distribution of the different TPH categories appears to generally align with the previous operations at the Site:

- nC_6 to nC_{12} Organics – Observed in DPT-21-20 on the northeast portion of the HWPW Recent Process Area (SWMU 4) where drying agents (e.g., petroleum naphtha consisting of lighter fraction carbon chain compounds, including benzene (PBW, 2010)) were stored and managed during operations. This TPH category was also observed at DPT-38-19 sampled near a former lagoon or pond within the Englewood IM Yard.
- $>nC_{12}$ to nC_{28} Organics – This TPH category appears to be predominately within the former lagoon area, but was also observed in DPT-21-20 on the northeast portion of the HWPW Recent Process Area (SWMU 4) and a lower concentration detected near the southeast end of the Railroad Tie Storage Area (SWMU 12);
- $>nC_{12}$ to nC_{28} Organics with High Aromatic Content and Low VOC Content – Observed within the former HWPW area (along the northern perimeter) and within the former lagoon within the Englewood IM Yard.
- Unresolved complex material (UCM) – Observed predominately in the soil samples collected near the former ASTs within the Englewood IM Yard.

The above categories and descriptions should be considered as preliminary generalizations only. Specific releases of different types of TPH and locations are not known, and the TPH has likely gone through various phases of weathering/depletion and may have been mixed during operations. As such, this evaluation of the specific TPH types and distribution should not be used to identify specific sources at the Site, but rather as a general guide to evaluate the range of TPH characteristics at the Site for establishing critical PCLs for the TPH categories.

3.3.3 Establishing Critical PCLs

The soil samples with the highest total TPH concentrations were chosen as representative samples of each category, analyzed for TPH fractionation by Method TX1006, and Tier 1 PCLs for Total TPH were calculated using the TCEQ TRRP Tier 1 TPH PCL Calculator (v 3.0 – 02/2020). The calculations are provided in Attachment H. Based on the TPH TX1006 results at each location, the hazard index was less than 10 (§350.76(g)(8)) and the TPH concentration is considered protective of the underlying groundwater, therefore, the soil to groundwater pathway for the TPH mixture is not complete and a $^{GW}Soil_{Ing}$ PCL was not calculated (TCEQ, 2010a). The lowest of the PCLs established for the different applicable exposure pathways is the $^{Tot}Soil_{Comb}$ pathway PCL and is the critical PCL for each category, as summarized in the following table:

Category	Location ID	Depth Interval (feet bgs)	Tier 1 $^{Tot}Soil_{Comb}$ $PCL_{TPH\ Mix}$ (30-Acre Residential) (mg/kg)	Tier 1 $^{Tot}Soil_{Comb}$ $PCL_{TPH\ Mix}$ (30-Acre Commercial/ Industrial) (mg/kg)
nC_6 to nC_{12} Organics	DPT-38-19	3-4	6,287	16,766
>nC_{12} to nC_{28} Organics	DPT-34-19	4-5	9,600	60,480
>nC_{12} to nC_{28} Organics with High Aromatic Content	DPT-35-19	4-5	7,504	70,247
Unresolved complex material (UCM)	DPT-42-19	4-5	5,797	57,967

The TPH Mixture PCLs listed above were then used as the critical PCLs to evaluate the total TPH by TX1005 Method soil sample concentration data. Following the same procedures for assessing the TPH by TX1005 data, the TPH data were evaluated against the critical PCLs by comparing to the following PCLs based on the location of the soil boring:

- Along the perimeter of the Site, soil sample results for total TPH were compared to the Residential Tier 1, $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$, and
- Within the interior of the Site, soil samples were compared to the C/I $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$.

3.3.4 TPH PCLE Zone

The total TPH concentrations for the soil samples in each category were compared to the calculated critical PCLs for each category detailed in Section 3.3.3 (Table 3). None of the soil samples had total TPH concentrations greater than the calculated C/I $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix,}$ and therefore there is no Total TPH PCLE Zone for soils at the Site. However, one soil sample collected from the perimeter had total TPH concentrations that exceeded the applicable calculated Residential Tier 1, $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$.

Total TPH concentration in the soil sample collected at DPT-12-20 (8-9 feet bgs) (8,070 mg/kg) exceeded the Residential Tier 1, $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$ for the >nC_{12} to nC_{28} Organics with High Aromatic Content Category of 7,504 mg/kg. This soil sample had total TPH concentrations less than the applicable calculated C/I $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$ (70,247 mg/kg). Based on this TPH result, additional sampling closer to the property boundary north of DPT-12-20 is recommended to evaluate the lateral extent of the total TPH concentrations in the surface soils.

3.4 TPH Assessment Conclusions

The TPH-NAPL Assessment followed the procedures outlined in the TCEQ Guidance Document RG- 366/TRRP-27 (TCEQ, 2010a). Based on the assessment, the following conclusions were developed:

- Delineation of TPH in soils using the TPH TX1005 data from the 56 soil samples indicated that the TPH concentrations were not delineated to the applicable TPH TX1005 PCLs on the western and northern perimeter of the Site. Surface soil sample from DPT-26-20 (2-3 feet) had a TPH C_{12}-C_{28} concentration of 3,300 mg/kg that exceeded the residential PCL but was less than the commercial/industrial PCL of 4,400 mg/kg. Soil boring DPT-24-20 located on the western perimeter north of DPT-26-20 had TPH concentrations less than the residential PCLs. Soil borings along the northern perimeter DPT-12-20, DPT-16-20, and DPT-21-20 each had TPH concentrations in the C_6-C_{12} and C_{12}-C_{28} ranges that exceeded the residential PCLs. Of those samples, only one had a TPH concentration that exceeded the commercial/industrial PCL (DPT-12-20 from 8-9 feet bgs, C_{12}-C_{28} range).
- The TPH-NAPL assessment within the Englewood Intermodal Yard indicated total TPH TX1005 concentrations in eight soil samples exceeded the Tier 1 $Soil_{Res}$ PCL of 10,000 mg/kg. Except for one location (DPT-42-19) located within the former AST area, the other seven locations are in the general area of the former lagoons. At each of these soil boring locations, either NAPL was visually observed or strong hydrocarbon odors were noted on the soil boring logs. The soil TPH TX1005 results are delineated to less than the Tier 1 $Soil_{Res}$ PCL to the north, south, east, and west. The information gathered from the TPH-NAPL assessment will be used to develop the NAPL response triggers for the TPH-NAPL area in the Englewood Intermodal Yard following the TCEQ guidance. The NAPL response triggers and resulting response action objectives will be detailed in the Revised RAP.
- An evaluation conducted by Golder indicated the following four different categories of TPH mixtures based on the TPH TX1005 predominant peaks in the GC graphs and fractionation data:
    - nC_6 to nC_{12} Organics – GC graphs indicate the presence of VOCs;
    - >nC_{12} to nC_{28} Organics – appears to be impacted by diesel or other fuels of similar composition;
    - >nC_{12} to nC_{28} Organics with High Aromatic Content and low VOC content – typical for creosote; and

  - Unresolved complex material (UCM) – potentially may include residual fuel oils (which have common names such as No. 4, 5, and 6 fuel oils) and bunker C or asphalt and lubricating oils.

- Using these four categories and representative TX1006 analytical data for each category, TPH mixture PCLs were calculated following TCEQ guidance. The TPH mixture PCL analysis indicated that the soil to groundwater pathway for the TPH mixture is not complete, and therefore the $^{Tot}Soil_{Comb}$ pathway PCL is the critical PCL for each TPH category.
- The developed TPH Mixture critical PCLs ($^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$) were used to evaluate the total TPH by TX1005 Method soil sample concentration data based on the identified TPH category for each sample. None of the soil samples had total TPH concentrations greater than the calculated C/I $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$, and therefore there is not a Total TPH PCLE Zone for soils at the Site. However, DPT-12-20 (8-9 feet bgs) soil sample collected from the northern perimeter had total TPH concentrations that exceeded the applicable calculated Residential Tier 1, $^{Tot}Soil_{Comb}$ $PCL_{TPH\text{-}Mix}$. for the $>nC_{12}$ to nC_{28} Organics with High Aromatic Content Category.
- Additional sampling closer to the property boundary north of DPT-12-20 is recommended to evaluate the lateral extent to the total TPH concentrations in the surface soils.

Notes:
1. All values in milligrams per kilogram (mg/kg).
2. Concentrations greater than applicable residential assessment level (RAL) are highlighted light yellow. RALs based on the lower of the Tier 2 ^{GW}Soil or Tier 1 $^{Tot}Soil_{Comb}$ PCLs (TRRP PCLs published November 2019).
3. Concentrations greater than applicable commercial/industrial (C/I) PCL are highlighted light orange. C/I PCLs based on the lower of the Tier 2 GWSoil or Tier 1 TotSoilComb PCLs (TRRP PCLs published November 2019).
4. Total TPH concentrations greater than 10,000 mg/kg (Tier 1 SoilRes PCL) in the vadose zone are highlighted blue.
5. Soil samples considered "interior", the analytical reults were compared to the C/I PCLs only under the focused on-site assessment.
6. J = Estimated value; < = Compound not detected at the specified detection limit.

Notes:

1. All values in milligrams per kilogram (mg/kg).

2. Concentrations greater than applicable critical PCLs are highlighted light gray (depending on location).

3. Tier 1 PCLs for Total TPH were calculated using the TCEQ TRRP Tier 1 TPH PCL Calculator (v 3.0 – 02/2020) for TCEQ Method 1006 Data for each TPH Category.

4. J = Estimated value; < = Compound not detected at the specified detection limit.

5. Soil samples considered "interior" (I), the analytical reults were compared to the C/I PCLs only, locations at the "perimter" (P) were also compared to residential PCLs.

1.0 TarGOST SYSTEM DESCRIPTION AND CALIBRATION

The Tar-specific Green Optical Screening Tool (TarGOST®) is a laser-induced fluorescence (LIF) screening tool specifically designed to detect non-aqueous phase liquid (NAPL) in the subsurface. It responds almost exclusively to heavy molecular weight NAPL/DNAPL phase contaminants including coal tars found at former manufactured gas plants (MGPs) and wood treating sites where creosote NAPL is the compound of concern. It does this by sensing the fluorescence of large polycyclic aromatic hydrocarbons (PAHs) found in heavy petroleum, MGP and creosote NAPLs. The TarGOST® is a modification of the Ultra-Violet Optical Screening Tool (UVOST®) that spun from LIF tools developed in the early 1990's under U.S. Air Force funding. The UVOST platform is a mature technology that has been applied at thousands of sites all over the world. TarGOST® has been in commercial use since 2003 and over 450 sites have been characterized using TarGOST.

The TarGOST system sends laser light through a fiber optic cable strung within probe rods on a direct push drill rig or cone penetrometer rig. The laser excitation light is directed out a sapphire window in the side of the probe. As the probe is advanced, the soil immediately adjacent to the window is exposed to the laser light. If heavy PAH containing NAPLs (i.e. bunker fuel, coal tar, creosote) are present, longer wavelength light is emitted (fluorescence). This "signal" light is transmitted through a return fiber, back to the surface to be analyzed. Responses are indicated in real-time on a graph of signal vs. depth. To aid in identifying relative quantity of the compound present, the main plot of a TarGOST log displays "color mixed" signal consisting of contributions from the scatter channel and three fluorescence channels. Scatter (Sctr), the first (blue) channel in waveform and fluorescence only (Fluor – the sum of the three fluorescence channels) graphs are separately displayed next to the main signal plot. The Fluor graph provides a view of the "true fluorescence" data without correction which is often helpful with lower concentrations of NAPL. The scatter signal by itself aids in detecting crude soil-color-like data and detection of false positives. Additionally, waveform callouts are selected and displayed to the left of the main plot to aid in NAPL or false positive identification.

Prior to conducting each log two measurements, the Reference Emitter (RE) and Background, are recorded. This is a calibration for the response of the system to a standard fluorescent material (the RE) and a measure of the cleanliness of the surfaces in the light path (e.g. fiber optics, mirror, window, filters). It is **not** a method of converting fluorescence to a known concentration but can be used to estimate concentration when carefully correlated with other lines of evidence. All down-hole measurements are subsequently normalized to a percentage of the RE response taken prior to the logging. For example, a 100% RE reading in-situ has a Signal identical to that of RE taken just prior to the log. Background (clean window) measurements are not applied to the data collected (i.e. it is not subtracted as a background) and is taken only as a general data quality measure employed by the operator to ensure there are no significant defects.

RE measurement serves two main purposes:

1) Qualitative examination of the performance of the instrument – The RE needs to be the correct shape to confirm that all four monitored wavelengths (fiber optics, filters, etc.) are intact and functioning properly.

2) Quantitative calibration of the instrument – The RE is used as a guide for the operator to achieve the proper signal intensity (obtained by adjusting laser energy). Keeping the RE waveform intensity in the proper range assures that the instrument is in the optimum range to allow a monotonic response across multiple orders of pore saturation for typical NAPL on typical soils.

RE total fluorescence ideally falls between 1,600 and 2,500pVs for TarGOST. PVs (picovolt-seconds), is a measure of waveform area, or total fluorescence. Precise RE intensity tuning by adjusting the laser excitation light to achieve an exact value is unnecessary because all reported data have been normalized by conversion to a percentage of the RE fluorescence (%RE).

Background values can range from 0 to 50 pVs. As the background increases beyond 50 pVs a change to the optics should be made to ensure the scatter correction applied to the data is effective.

RE and Background values for each boring are shown in the data summary portion of this report. Additional in-depth information about the TarGOST technology, field implementation and limitations are discussed in the TarGOST Guide included in Appendix C.

2.0 DATA PRESENTATION FORMATS

TarGOST data is presented in two formats. Signal (%RE) vs depth logs and clustering diagrams. Both formats are included in Appendix A.

Signal (%RE) vs depth logs are created in the field by the operator for immediate examination. Post-project these logs are reviewed and necessary changes in scaling or waveform callout selections are completed. Two scales have been chosen for your logs:

1) **0-100%RE**- all logs with the x-axis fixed from 0-100%RE. Note that this will cut off signals above 100%RE. This allows for closer examination of smaller signals. The fluorescence only column x-axis is also fixed at 0-20%RE again, this is for closer examination of small signals.
2) **0-Autoscaled high signal**- only logs that had signals over 100%RE will have the x-axis auto scaled to the max RE for that log.

Both sets of logs have a fixed depth scale of 0-65ft at the request of the Golder. More information on Signal vs Depth logs can be found in the TarGOST Reference Log in Appendix B. If other scales are desired, please do not hesitate to contact Dakota at 701-237-4908.

Clustering diagrams are a fast method to survey for differences in waveforms between various locations on site or even between differing response horizons within a single log. Information from all the waveforms of a single TarGOST log are plotted on a 2D surface, allowing a spatial method of grouping or identifying unique and/or dissimilar fluorescence waveforms. Additional information on clustering diagrams can be found in the discussion section of this report.

3.0 DISCUSSION AND COMMENTS

The site was split into two units divided by railroad tracks running SW to NE, the South side of the tracks or Intermodal facility and North side which included the vacant property and locations in the right of way of the neighborhood. For purposes of discussion the data set will be examined as a whole. Likewise, the data is presented as a singular group, not split into the designated North and South sites.

Careful co-sampling, examination, and analysis of soil cores are required to determine what benefit the waveforms (three-dimensional fluorescence signatures) may or may not provide toward identifying certain fluorescence materials encountered in-situ.

3.1 WAVEFORMS

There are two very closely related waveforms that dominate the data set. These waveforms believed to be associated with target NAPL because they match the waveform of a sample that was taken from an area of the site where NAPL material is seeping from the ground. Factors that may contribute to slight variations include instrumental differences, weathering, soil matrix, product mixing or co-mingling, and other NAPL composition differences. All of these can play a role in how a material ultimately fluoresces. An in-depth chemical analysis of samples taken from locations with differing waveforms may provide some answers. Below are examples of these waveforms.

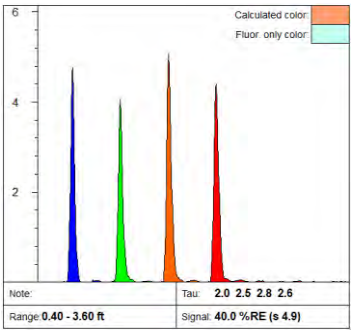

Fig 1a. Material from seep

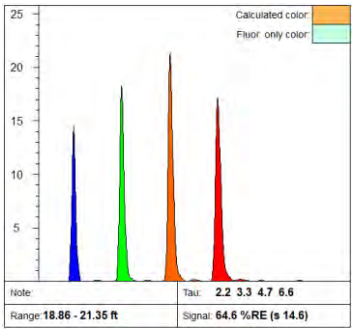

Fig 1b. NAPL waveform #1

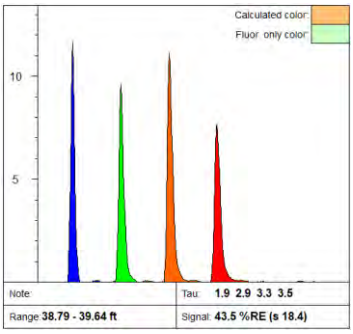

Fig 1c. NAPL waveform #2

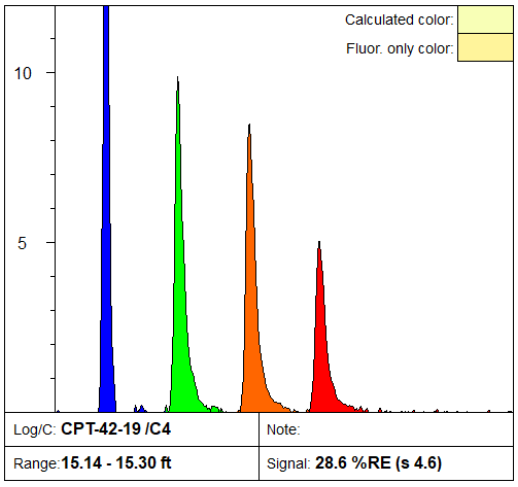
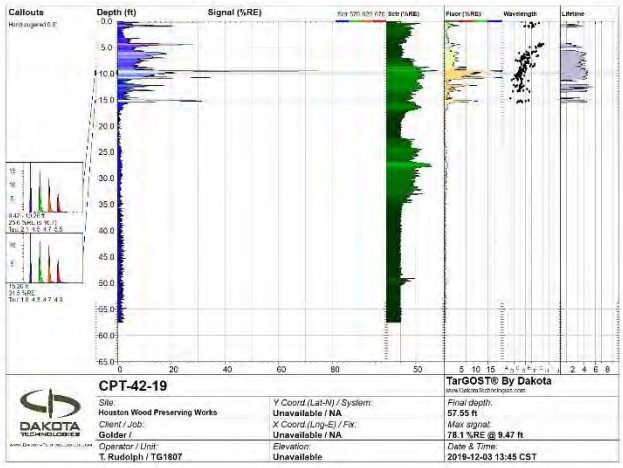
Examination of the waveforms starts with overall shape and intensity of the three fluorescence peaks (color-coded green, orange, and red). The seep waveform in Figure 1a has a dominant orange peak with a slightly less intense red and green peaks. The calculated color of the waveform in the main plot as well as the fluorescence only colors are displayed in the upper right corner of each waveform. When reviewing logs look for these colors to indicate fluorescence that matches these waveforms. Also important in waveform examination is lifetime of the fluorescence. This is observed in the "width" of the peaks and is especially evident in the base of each peak. Wider peaks mean longer lifetimes while shorter lifetimes show up as narrow peaks. Changes in lifetimes are easily detected in cluster diagrams discussed in Section 3.2. Figure 1b shows the common NAPL waveform seen across the site we will refer to this as NAPL waveform #1. This waveform is very similar to the seep material, the minor difference is in the intensity of green and red peaks in relation to the dominate orange peak. Again, the calculated colors are displayed, and they are only slightly different than the seep waveform. In figure 1c the red peak is less intense and there is a very subtle increase in lifetime (slight widening of the base of the peaks). This waveform will be referred to as NAPL waveform #2. Often NAPL waveforms 1 and 2 are seen within the same log. This leads one to believe they are closely related – the same basic NAPL with subtle chemistry differences (origins unknown).

There are also a few examples of logs with fluorescence that doesn't appear to be the main NAPL of concern. Below is an example of one of them. Notice the differences in waveform shape from waveforms





#1 and #2.

This example is from location CPT-42-19 at 15.2ft. The waveform is most intense in the green channel with lessening intensity in the orange and red channels. The lifetime (width of the peaks) is also longer than the NAPL waveforms. Although it is not certain what this waveform represents, it is certain that it is not the same chemistry as the NAPL of concern based on the waveform analysis. This could well be a NAPL, of course, but with markedly different chemsitry (likey lighter – such as diesel). Careful sampling of locations with waveforms of unconfirmed origin like these can answer the uncertainties.

3.2 CLUSTER DIAGRAMS

Clustering diagrams are the fastest method we have found to quickly survey for differences in the waveforms between differing LIF logs or differing response horizons within a single log. These are included for each boring in Appendix A. The diagrams are broken into a 10 x 10 grid using a letter (columns) and number (rows) system. The letters from A to J represents the wavelength (x axis). The numbers 0-9 represent the lifetimes (y axis). This facilitates easy location and discussion of plotted data points. The number and letter values are also plotted on the signal vs depth logs to the far right of the main data. The numbers and letters correspond directly to grid locations on the cluster diagrams.

Cutoff Values

Every waveform of a log is represented by a colored oval on a cluster diagram. Depending on depth and rate of advancement the number of waveforms per log can number in the thousands. Many of these waveforms are of little interest because they are very small (background or clean zones of the log) and

don't rise above electronic baseline noise that "confuses" the software that breaks each waveform down into four intensities and three lifetimes. We typically implement a threshold or cutoff value which prevents data that falls below the threshold from being included in the plot and thus eliminates a lot of the scattered confusing data from interfering with the significant signals. Often this value is 5%RE or below. A value of 2%RE was chosen for this data set. The cutoff value, if implemented, is displayed at the bottom of each cluster diagram. Since all the locations were pre-cleared and backfilled the data in the pre-cleared interval is unreliable and may contains false positive fluorescence. For this reason, a cutoff corresponding to the depth of the pre-cleared interval was also implemented. Data points in the 0-10ft or 0-8ft interval were not plotted on cluster diagrams to avoid confusion. This cutoff is also displayed across the bottom of the clustering diagram. Note that all the data (including any pre-cleared interval) is displayed on the depth vs signal plots.

X-Axis: Wavelength

The "center of gravity" of the four peaks of the waveform determines the x-axis position. For example, a clean waveform dominated by the blue (laser scatter peak) plots to the left – while a waveform with dominant orange and red peaks will plot further to the right. The x-axis represents the fluorescence color (yellow on left, red on right).

Y-Axis: Lifetime

The fluorescence channel lifetimes determine the position on the y-axis of the clustering diagram. The longer the combined lifetimes, the higher on the y-axis that waveform's data point is plotted. Laser scatter (blue channel) is ignored here – because the excitation laser time profile doesn't change.

Color

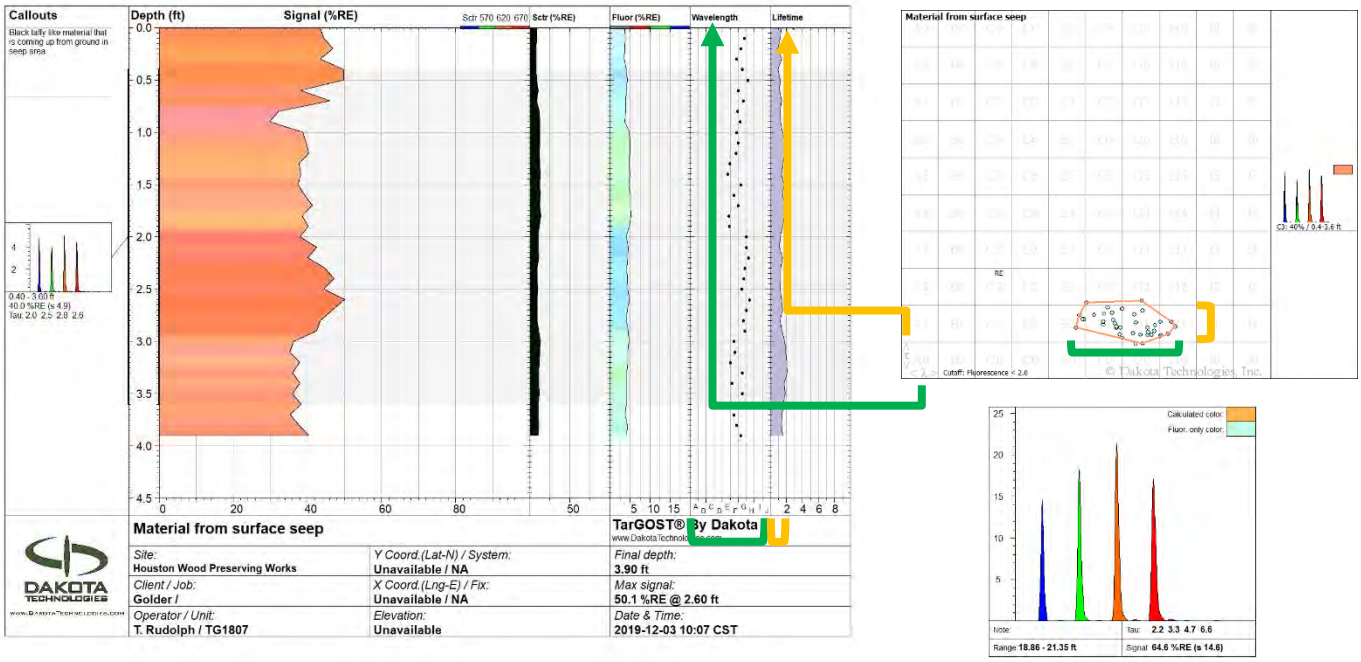
The fill colors used in the log's Fluor (%RE) only column are also used to fill the ovals that represent each waveform. This is done so that one can use the fill color to find the depth in the Fluor (%RE) only column of the TarGOST log where certain ovals originated. For instance, if the fill color of plotted ovals are pink, look for depths at which the Fluor (%RE) only column of the log that was filled with pink. This allows you to target where on the log to make further examination of the waveform to locate sampling depths or otherwise investigate your TarGOST data more fully.

Callout Indicators

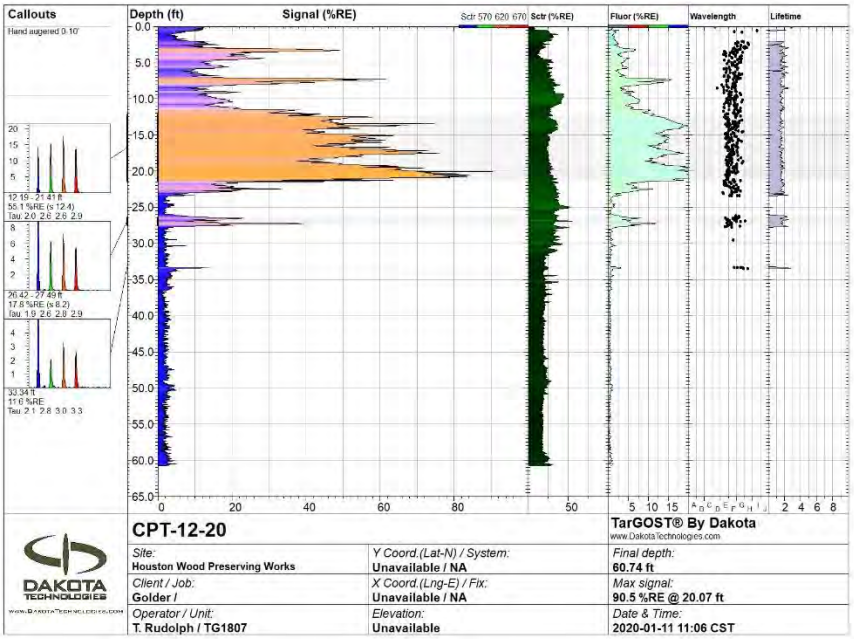
The polygons and/or circled data points on the clustering diagrams represent the data points that were selected for waveform callouts on the main log. If a depth range of the log was selected for a callout the software will draw a polygon connecting the min/max of that range for both the x axis and y axis. If a single data point was selected for a callout that data point will be circled. They will be drawn in colors

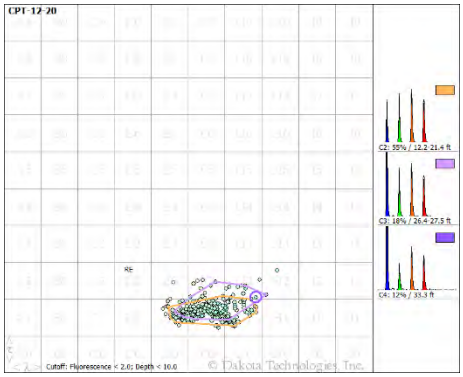
matching that of the fill color for the waveform that was called out. Additionally, the callouts are shown to the right of the diagram. The fill color of the callout is shown along with the depth interval it represents.

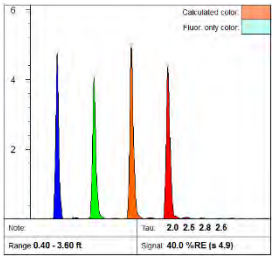
The waveforms discussed in Section 3.1 will likely plot in different areas on the cluster plot due to the slight differences in waveform channel strengths and lifetimes. Below is an example of each waveform discussed, a cluster diagram and the corresponding log.



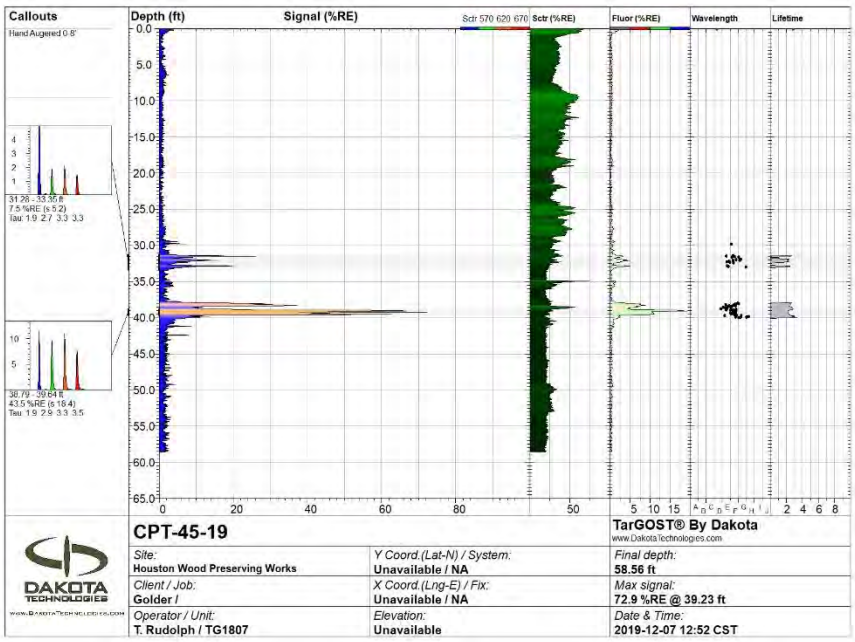
This example from the seep material shows the log (left) cluster diagram (top right) and waveform (bottom right). Notice how the points on the cluster diagram are concentrated mainly into one area E1,F1,G1. In the wavelength column of the log these data points are plotted within the E,F,G columns and the 1 column the lifetime column.

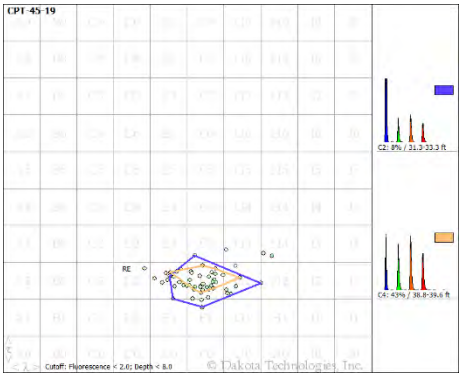


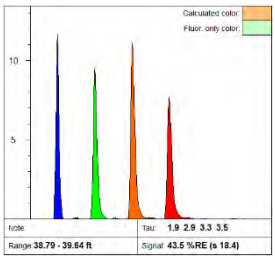




CPT-12-20 is an example of NAPL waveform #1. Again, the cluster plot is showing the majority of data points are falling in the E1,F1,G1 locations. This is consistent with material from the seep. Some logs that exhibit this waveform are: CPT-30-19, CPT-35-19, CPT-36-19, CPT-24A-20



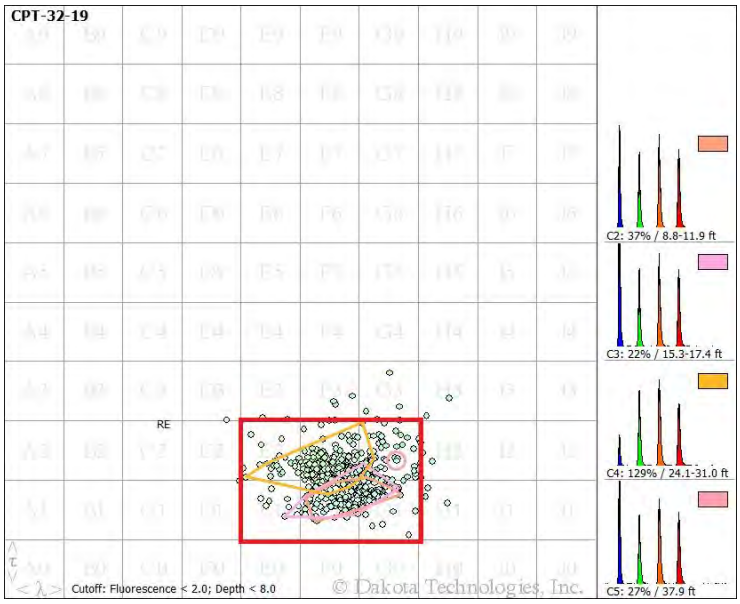




CPT-45-19 is an example of NAPL waveform #2. By only examining the signal vs depth log it appears the signal may be consistent with the previous examples, but the cluster diagram highlights the subtle difference, with waveforms clustering in the E2,F2,G2 location. This is a shift up due to a slight increase in lifetime. Waveform's fluorescence color is similar (the wavelength axis location hasn't changed from the E,F,G columns) but lifetime has increased which moves them from the 1 row up to the 2 row. As stated previously the reason for this modest but noticeable shift is not known. Other logs with this waveform include: CPT-39-19, CPT-40a-19, CPT-46-19, CPT-27-20.

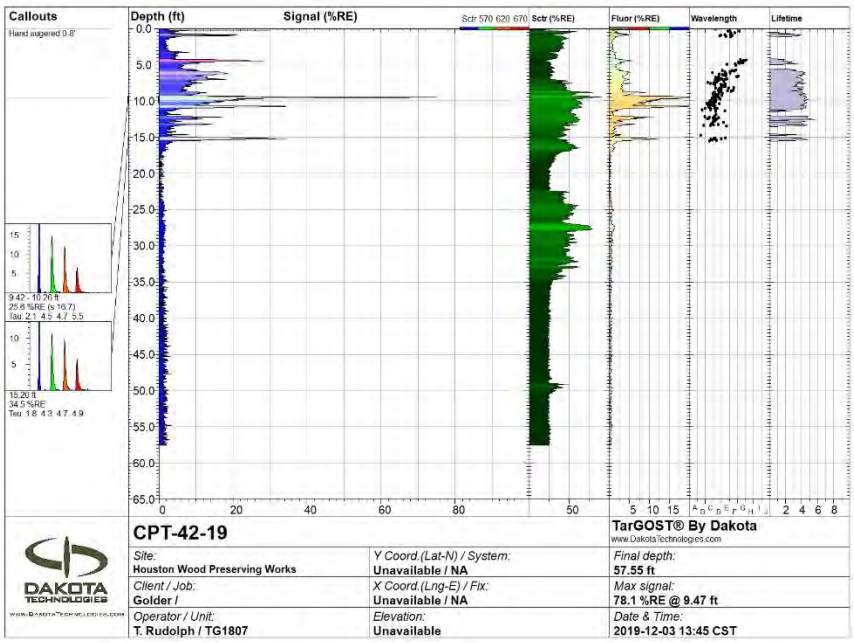
There are several logs in which both NAPL waveforms are present. Examples of those are: CPT-29-19, CPT-30-19, CPT-32-19.

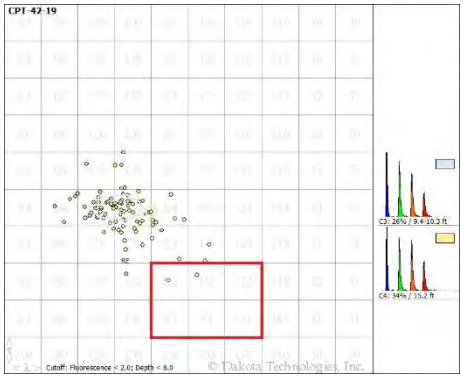
Through the examination of waveforms and clustering diagrams some trends can emerge, and reasonable conclusions can be made. For this data set the common NAPL waveforms plot in the same general areas on the cluster plots – E1,E2,G1,G2,F1,F2.

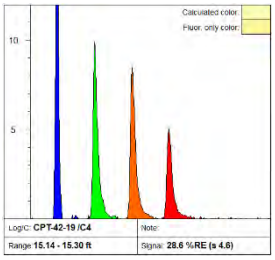


In this example from CPT-32-19 a red box was drawn to highlight the area the data points plot for the 2 NAPL waveforms. While reviewing the logs, focusing on this area in the clustering diagram can aid immensely in identifying potential NAPL.

The final example is from CPT-42-19. For reference, the previously discussed red box is left in place to mark the target NAPL waveform's clustering area.







The fluorescence in this log is clearly different and therefore it is not plotting in the area where the target NAPL waveforms generally fall, but instead is plotting further to the left and higher on the diagram. This indicates a "blue-shift" to the left in the waveform as well as an increase in the average lifetime. The waveform example demonstrates this, with the green channel dominating and the width of the peaks broadening due to a longer fluorescence lifetime. This is obviously not the target NAPL of waveform #1 or #2. Other logs that contain this relatively uncommon waveform are: CPT-17-20 @ 14.5' (callout 2), CPT-21-20 @41' (callout 4).

A few points to consider while interpreting this projects TarGOST logs include:

- All the locations were pre-cleared and backfilled with clean sand. Data collected in that interval is considered unreliable. For that reason, signals and waveforms in that interval aren't discussed in this report.
- CPT data was collecting in conjunction with the TarGOST data. Dakota has limited experience interpreting CPT data and therefore it is not addressed here.
- Sampling was not conducted in conjunction with the TarGOST while Dakota was onsite. If validation sampling is conducted it is important to consider site soil heterogeneity. We have found that often soil structures differ within several feet if not inches. For this reason, it is recommended that while logging with TarGOST an occasional duplicate boring is advanced within a few feet of an original boring. These duplicates give some indication of site heterogeneity and help with interpretation of the data. Although no direct duplicate borings were advanced, several offsets were in areas where target depths were not achieved. To some extent these may be used in the same manner to indicate heterogeneity.

4.0 LIMITATIONS

The analysis and opinions expressed in this report are based upon TarGOST data from the indicated locations and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying comments section of this report. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted practices. Reported results shall not be reproduced, except in full, without written approval of Dakota. No warranties, expressed or implied are intended or made.

Additionally, the following are known limitations of the TarGOST technology and should be carefully considered while evaluating TarGOST data:

- TarGOST specifically targets the PAHs found in NAPLs such as bunker fuel, former MGP and creosote NAPLs and DNAPLs. There are most certainly other fluorescent molecular structures beside PAHs that contribute in some minor fashion, but the PAHs dominate fluorescence in most NAPLs
- TarGOST can/does detect moderate staining and residual levels of NAPL as well as free phase
- TarGOST is completely "blind" to aqueous (dissolved phase) PAHs with the exception of water near some acid tars
- TarGOST is **not** able to reliably detect "dry" PAHs (dry in the organic solvent sense) that are sorbed to soot, wood chips, and ash. They can generate a small signal, but it is often weak and not easily teased out of the background. Many times, we're left wondering whether a small signal is caused by very high

concentrations of “dry” PAHs on purifier chips or ash/soot or very low (100s of ppm) residual NAPL levels.

- TarGOST’s typical lab-determined LOD for NAPL on site soil is 100-500 ppm (weight of NAPL/weight of soil matrix). The more intensely the NAPL fluoresces, the lower the LOD. Note that this is not the same as weight of Total PAHs /weight of soil matrix (since not all of a NAPL’s mass is due to PAHs).
- TarGOST does, on occasion, respond to mineral or organic matter enough to be a nuisance – even blinding in rare cases. False positives include crushed limestone gravel fill, buried rotting wood/brush debris (the result of major flooding on a gravelly river), seashells (shell hash), sawdust, quick lime, and some “mystery” solids/soils that were not identifiable upon sampling.
- TarGOST has been observed to significantly respond to peat material, but most peats fluoresce weakly – often there is NAPL in the peat so it’s difficult to know for sure whether it’s been the peat or NAPL staining that’s causing the fluorescence.
- TarGOST does not respond to typical lighter end fuels like gasoline or kerosene (diesel is detected however) – unless they contain MGP waste or creosote that they are co-mingled in them.
- TarGOST calibration/setup isn’t identical unit to unit or time after time, so the response for an identical NAPL can vary with optical platform and from lab to field. However, once set up on site, the response remains stable over time and from log-to-log.
- NAPLs can vary greatly in their fluorescence response – even NAPLs found on the same site from the same source. For instance, as NAPL travels it can often leave the “stickier” molecules behind, refining itself along the journey, so the waveform often shifts as the NAPL movies further and further from the original release site.

Appendix B

TarGOST Reference Log

Dakota Technologies TarGOST Reference

2013-08-09

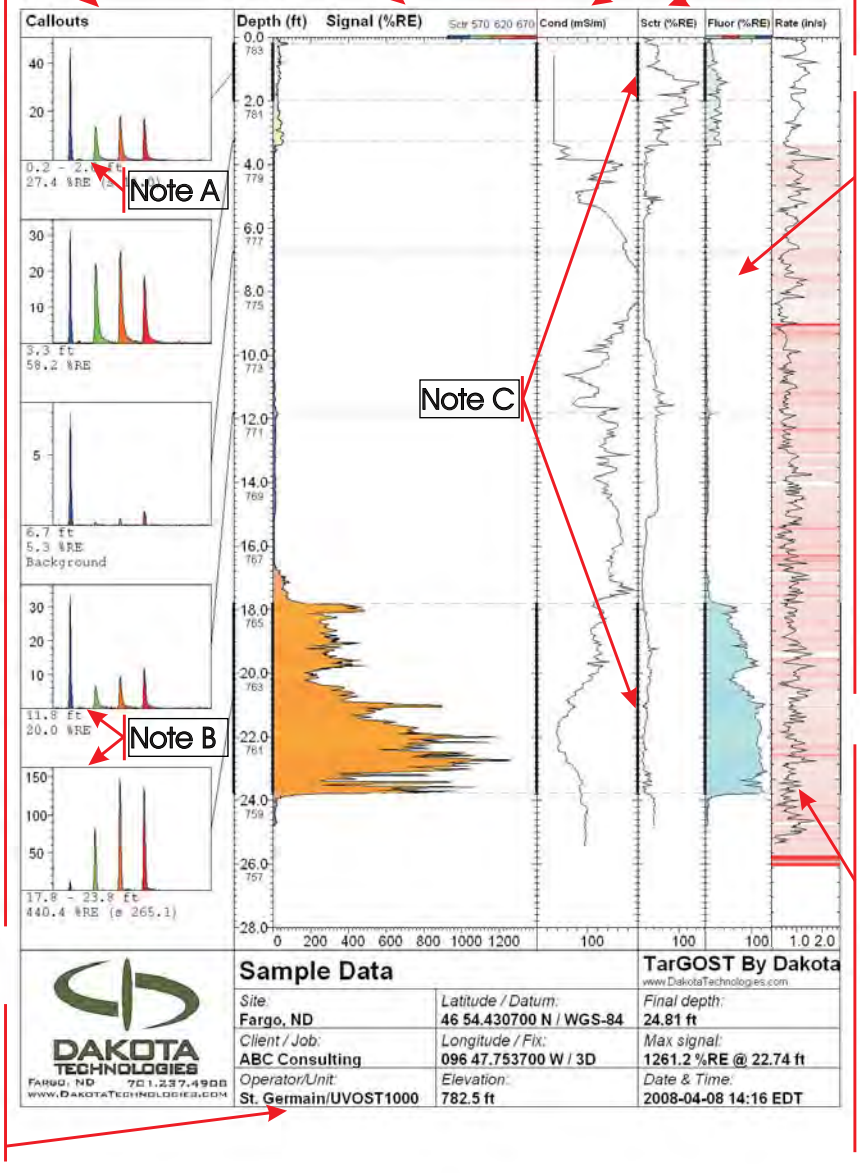
Main Plot :
Signal (total fluorescence) versus depth where signal is relative to the Reference Emitter (RE). For TarGOST data, the signal is scatter corrected due to tar's non-linear fluorescence with increasing concentration. The fill color is based on relative contribution of each channel's area to the total waveform area (see callout waveform). The channel-to-color relationship and corresponding center wavelengths are given in the upper right corner of the main plot. For TarGOST data, the first channel (blue) is always representative of the scatter.

Callouts :
Waveforms from selected depths or depth ranges showing the full mullti-wavelength waveform for that depth.

Each colored area peak is due to light at the four wavelengths. These four peaks / wavelengths are often referred to as channels.

Various products will have a unique waveform fingerprint due to the relative amplitude of the four channels or broadening of one or more channels in the time-domain.

Basic waveform statistics and any operator notes are given below the callout.



Info Box :
Contains pertinent log info including name and location.

Conductivity Plot :
The Electrical Conductivity (EC) of the soil can be logged simultaneously with the TarGOST data. EC often provides insight into consolidated versus unconsolidated stratigraphy.

Scatter Plot :
Scatter versus depth where intensity is relative to the scatter level of the Reference Emitter.

Fluorescence Plot :
A plot of the fluorescence signal alone versus depth. The scatter channel is not used in the calculation of signal intensity or coloring. Note the coloring key at the top of the plot. Intensity unit is percent of Reference Emitter fluorescence. Varying soil or product can often be visually pulled-out from the background based on the fill color of this plot if scatter dominates the color of the main plot.

Rate Plot :
The rate of probe advancement. Less than 0.8in (2cm) per second is preferred.
The red fill is the hammer counts, the number of strikes used to advance the probe. The rate and hammer counts can be indicative of various soil conditions.

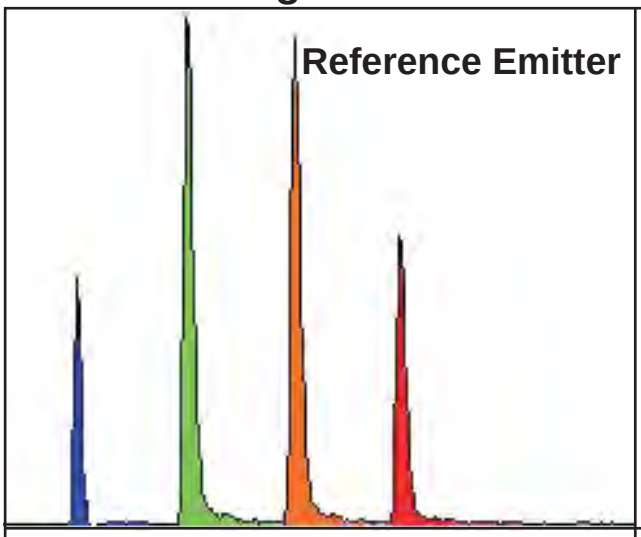
Note A :
Time is along the x axis. No scale is given, but it is constant and is roughly 250ns wide.

The y axis is in mV and directly corresponds to the amount of light striking the photodetector.

Note B :
These two waveforms show two different products, each with a unique waveform.

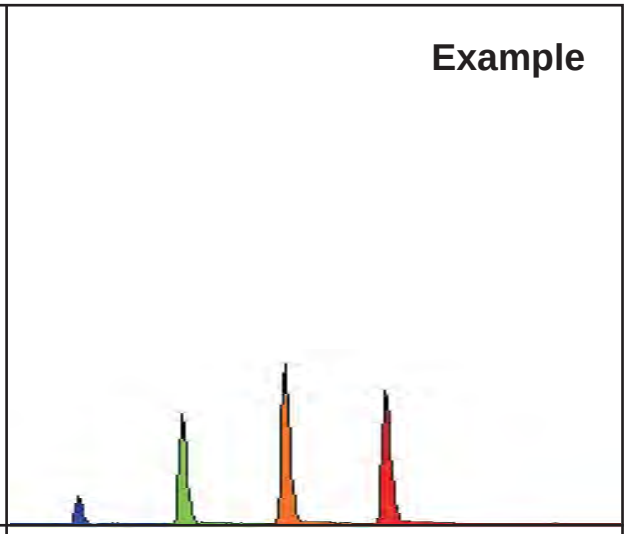
Note C :
The top zone has moderate fluorescence, but high scatter while the bottom zone has high fluorescence and low scatter. Note how this impacts the main signal plot.

Waveform Signal Calculation



Sctr	CH2		CH3		CH4		Fluor		Total%
255	785	+	772	+	462	=	2019	»	100/100
100	38.9		38.2		22.9		100		100%

Channel
Area (pVs)
Percent RE



Sctr	CH2		CH3		CH4		Fluor		Total%
36	153	+	244	+	226	=	623	»	31/14
14.1	7.6		11.1		11.2		31		219%

Data Files

***.lif.raw.bin**	Raw data file. Header is ASCII format and contains information stored when the file was initially written (e.g. date, total depth, max signal, gps, etc., and any information entered by the operator). All raw waveforms are appended to the bottom of the file in a binary format.
***.lif.plt**	Stores the plot scheme history (e.g. callout depths) for associated Raw file. Transfer along with the Raw file in order to recall previous plots.
***.lif.jpg**	A jpg image of the OST log including the main signal vs. depth plot, callouts, information, etc.
***.lif.dat.txt**	Data export of a single Raw file. Tab delimited format. No string header is provided for the columns to make importing into some programs easier. Each row is a unique depth reading. The columns are: 1-Depth; 2-Total Signal (%RE); 3-Ch1%; 4-Ch2%; 5-Ch3%; 6-Ch4%; 7-Rate; 8-EC Depth; 9-EC Signal; 10-Hammer Rate Depth; 11-Hammer Rate; 12-Color (RRGGBB).
***.lif.sum.txt**	A summary file for a number of Raw files. ASCII tab delimited format. The file contains a string header. The summary includes one row for each Raw file and contains information for each file including: the file name, gps coordinates, max depth, max signal, and depth at which the max signal occured.

Non-Linear Fluorescence

Due to self-absorption, fluorescence levels (channels 2-4) are not linear with concentration, requiring the use of scatter (channel 1) correction. Creosote on sand, y-axis scaling is equal.

A Introduction

The Tar-specific Green Optical Screening Tool (TarGOST®) is a laser-induced fluorescence (LIF) screening tool that is specifically designed to detect non-aqueous phase liquid (NAPL) in the subsurface. It responds almost exclusively to NAPLs found at former manufactured gas plants (MGPs) and wood-treating (creosote/pentachlorophenol) sites. It does this by sensing the fluorescence of polycyclic aromatic hydrocarbons (PAHs) and any other fluorescent molecules found in MGP and creosote LNAPLs and DNAPLs. TarGOST is a modified version of Ultra-Violet Optical Screening Tool (UVOST®). Dakota developed the UVOST early in the 1990's with U.S. Air Force funding. The UVOST platform is a mature technology that has been applied at hundreds of petroleum, oil, and lubricant (POL) contaminated sites in the U.S., Europe, and Japan since 1994. TarGOST has been in commercial use since March 2003.

B Principles of Operation

B.1 Components

The following gives an introduction to the basic components of the system.

- **Laser**

  The laser is up-hole and produces concentrated light of one narrow range of wavelengths. For TarGOST, the laser produces short (5 billionths of a second) pulses green light, as opposed to Dakota's UVOST system that uses an ultra-violet laser for excitation.

- **Fiber-Optic Cable**

  The fiber-optic cable is a robust plastic coated metal conduit that houses two fiber optic cables and the wires for the conductivity measurement. This cable is strung through the probe rods prior to field activities. One fiber carries the laser down to the probe while the other returns scattered laser and fluorescent light.

- **Shock Protected Optical Chamber (SPOC)**

The distal end of the fiber optic cable attaches to the SPOC. The SPOC houses a mirror that turns the light and a sapphire window. Light passes through the window and strikes the soil in immediate contact with the window. The resulting scattered and fluorescent light is sent up-hole for measurement. The SPOC has channels that allow the conductivity wiring to pass through to the dipole tip at the bottom of the assembly.

- **Spectrometer**

The TarGOST's custom spectrometer divides the returning light into four distinct wavelength (or color) bands and converts the light into a corresponding electrical current where the current amplitude is proportional to the light amplitude.

- **Analog to Digital Converter**

The A/D converter produces an averaged digital signal from the current provided by spectrometer that can be read by the computer software.

- **Conductivity**

The electrical conductivity of the soil can be logged simultaneously with the LIF information.

- **Depth Meter and Hammer Rate**

Depth is tracked by a string potentiometer system on the direct push equipment to insure that the optical data is tagged with its proper depth. Data density is generally less than one inch. We can also track our Hammer Rate when using a percussion delivery platform.

- **Computer and Software**

All data is logged using Dakota's proprietary Optical Screening Tool (OST) software running on a Windows platform. We use ruggedized field laptops.

B.2 Laser-Induced Fluorescence

The TarGOST system is, in its simplest sense, a front-face fluorometer that is coupled via fiber optics to a sapphire-windowed probe that is advanced into the ground.

> A front-face fluorometer is a device that shines excitation light onto, and collects emission from, the same surface. This is different from conventional fluorometers, which operate with the excitation and emission beams at 90° and usually involve clear liquid analytes.

The TarGOST system makes continuous measurements of the soil matrix as the windowed probe is pushed slowly into the subsurface.

> The measurements are made hundreds of times each second. Each individual measurement begins with a pulse of laser excitation light being launched into one of two optical fibers that are strung through the drill/push rod string. As the rod is advanced into the subsurface, the very fast pulses of laser light (nanoseconds in duration) are directed out the sapphire window and onto the soil surface that is pressed very firmly against the outside of the window.
>
> Pulses of laser light strike whatever is present just outside the surface of the window. Most of the laser light is simply reflected by the soil matrix. However, if oil-like material (OLM) or tar-like material (TLM) containing PAHs (or other fluorescent molecules) are present, the PAHs that exist in these NAPLs absorb some of the light and are driven into an electronically excited state. When these PAHs eventually return to the ground state (this typically takes less than 10 ns), a portion of the PAHs emit red-shifted light (longer wavelength light than the excitation laser). Some of this fluorescence, along with a portion of the reflected excitation laser light, are collected by the SPOC's mirror and focused into the collection optical fiber for return to the TarGOST instrument for detection.

The light returning from the windowed probe is directed into a spectrometer located inside the TarGOST system, yielding a waveform.

The TarGOST's custom spectrometer divides the returning light into four distinct wavelength (or color) bands and converts the light into a corresponding electrical current pulse where the current amplitude is proportional to the light amplitude. This current pulse is wired into a fast digital storage oscilloscope where it is converted into a transient voltage signal, is digitized, and recorded. This digitized transient is called a waveform.

Figure 1 shows an example waveform. Each peak (or channel) represents a different wavelength band. The laser light that is being reflected from the soil matrix is monitored in the first channel (blue, left-most) and the three fluorescence bands are observed in the three right-most channels (green, orange, and red).

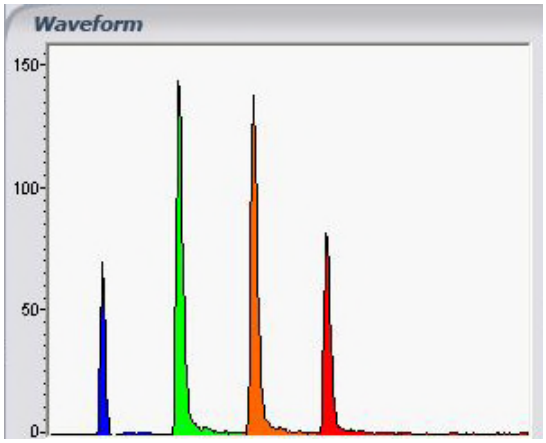

Figure 1. Example TarGOST Waveform

B.3 Scatter Correction

Due to complicated processes such as energy transfer, photon cycling, and other phenomena that "quench" the fluorescence in high NAPL concentration soils, fluorescence often does not scale linearly with concentration. To correct for this inherent property, the TarGOST system scatter corrects the data.

In calculating the TarGOST total signal, the fluorescence area is divided by the area under the laser scatter channel. This is referred to as scatter-correction or normalization. This is necessary because at very high concentrations the fluorescence does not continue to scale with concentration. The uncorrected TLM curve in Figure 2 illustrates the problem.

The addition of more and more NAPL to a soil sample should (if there were no quenching phenomenon) result in increasing fluorescence, but it only increases up to a certain point where the fluorescence response flattens out or begins to fall.

This poor type of response is called non-monotonic behavior and is obviously undesirable behavior for a screening tool. The laser scatter correction system is designed to prevent this "roll-over" affect. The scatter correction keeps this from occurring at the high end of concentrations (where soil is heavily contaminated or even saturated with NAPL). The scatter-corrected curves in Figure 2 illustrate the desired effect of scatter correction.

The laser scatter intensity is usually minimal until NAPL concentrations reach the tens or hundreds of thousands PPM level, where the quenching or saturation (non-linearity of fluorescence response) is most pronounced. Laser scatter correction generally doesn't "kick in" until high concentrations are being measured, where fluorescence response flattens out or rolls over. In this way, the scatter corrected fluorescence readings scale relatively well across a wide range of concentrations, from the typical limit of detection (LOD) of 250-500 ppm, to the almost neat NAPL encountered in soil saturated with free product. Remember that TarGOST is designed to respond only to the NAPL impacted soils, not the PAHs attached in "dry" form to soot or dissolved phase PAHs. This makes it ideal for delineating source term areas of mobile MGP NAPL.

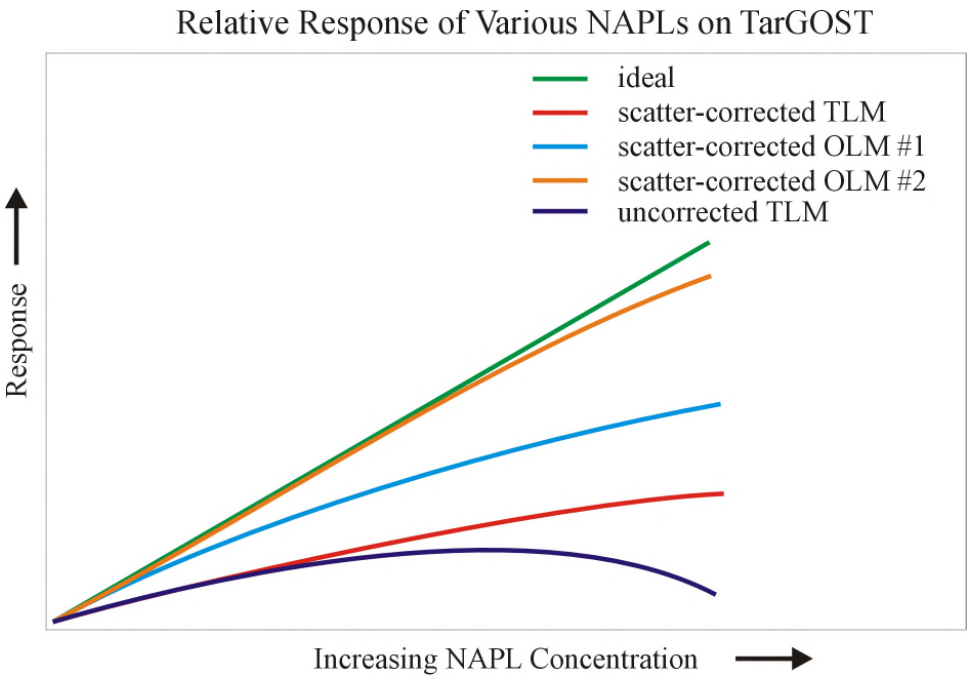

Figure 2. Variability of TarGOST Repsonse

The scatter correction works well, but it isn't perfect.

The TarGOST system is not an analytical instrument like a laboratory GC that sits in a clean, stable environment and only gets fed ultra-clean matrix-isolated analytes. Instead, it is asked to respond faithfully to an analyte that exists in a thousand different forms in an endless number of environments.

At high NAPL concentrations, even small variations in the laser scatter greatly influences the total signal, especially when the laser scatter gets close to zero.

For instance, let's imagine that with neat NAPL in front of the window, the fluorescence channels are averaging around 10,000 pico-Volt seconds (pVs) in area with each pulse of the laser. The laser scatter may be fluctuating between 400 and 800 pVs, because the scattered light is dim from being absorbed by the PAHs. Now, even if the fluorescence stays almost constant at 10,000 pVs every measurement, the relatively large variation in the tiny laser scatter that occurs will create a two or three-fold increase/decrease in total signal, even with the same NAPL sitting on the window. That's why very high readings (>500) often look unstable and jagged – because the laser scatter signal is so weak it "jitters" a lot compared to the fluorescence, causing large variations in signal, even though the fluorescence portion of the waveform is relatively stable. For this reason, any wide swings in large signals should "be taken with a grain of salt".

At low signals (0-100 %RE), it is often helpful to use the Fluor (%RE) or "Fluorescence Only" column of data. At low concentrations the change in scatter from the formation itself might actually "mess with" the Signal, causing it to change for reasons other that NAPL content. The Fluor column is the most reliable indicator of NAPL at near limits of detection quantities.

B.4 Calibration and Signal Calculation

The waveform shapes (the relative amount of signal in each channel or band and the decay time on the right side of each peak) tell us quite a bit about the qualitative nature of what's happening outside the window. But what interests people most is the amount of NAPL that is present vs. depth. We do this by portraying the signal vs. depth in a continuous log format, where the signal is relative to a known fluorescence reference emitter (RE).

To accomplish this we must reduce the waveform to a single quantitative number. We also need to normalize for any energy drift of the laser and optical alignment changes, so it is necessary to calibrate the system prior to each

sounding and plot the down-hole data. The RE is a stable and known material that can be applied to the window and measured just prior to each sounding. The signal of the down-hole sample is then plotted as a function of depth and a percent of the RE.

Figure 3 graphically illustrates the calibration waveform and its use in the determination of an example %RE.

The RE both reflects some of the laser light and fluoresces at levels that are in the same general range as soils that are moderately to heavily contaminated with MGP NAPL. The Reference Emitter waveform shown in the figure is an actual RE waveform taken with the TarGOST. By definition the RE will always have a %RE value of 100%. The example waveform on the right is a real waveform of impacted soil; notice the low scatter in the example and its impact on the total signal level of 219%.

To calculate the %RE, the area under the three fluorescence channels of the waveform is determined. As discussed in the previous section on scatter correction, the fluorescence area is divided by the laser scatter area. This fluorescence over scatter value is divided by the corresponding RE value and reported as a percent.

Once the RE is measured, all subsequent measurements can be normalized by this RE waveform, providing an apples-to-apples presentation of the data regardless of laser energy drift or other changes that would cause a difference in raw signal amplitude over time. It may be useful to think of the RE waveform as the equivalent of the single-point 100ppm isobutylene calibration used for hand-held photo-ionization detectors.

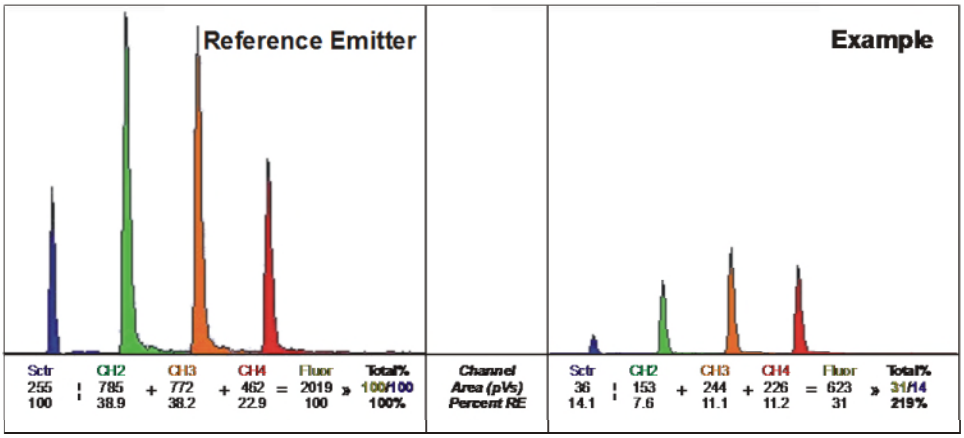

Figure 3. Example %RE Calculation

B.5 Signal vs. Depth Plotting

To better appreciate the qualitative information that TarGOST provides, the logs are color-coded by "filling in" the log's x-axis (%RE) with colors generated from the waveform at each and every depth. The color is determined by the amount of signal present in each of the four wavelength channels. See Figure 4 for an example.

This makes the interpretation of the logs easier to see "at-a-glance" as opposed to relying solely on the few selected waveforms to understand the qualitative nature of the data vs. depth. Color-coding alerts the observer to shifts in NAPL types and can also help identify weak interfering minerals like calcite and organic matter, both of which can sometimes (rarely) be mistaken for MGP waste.

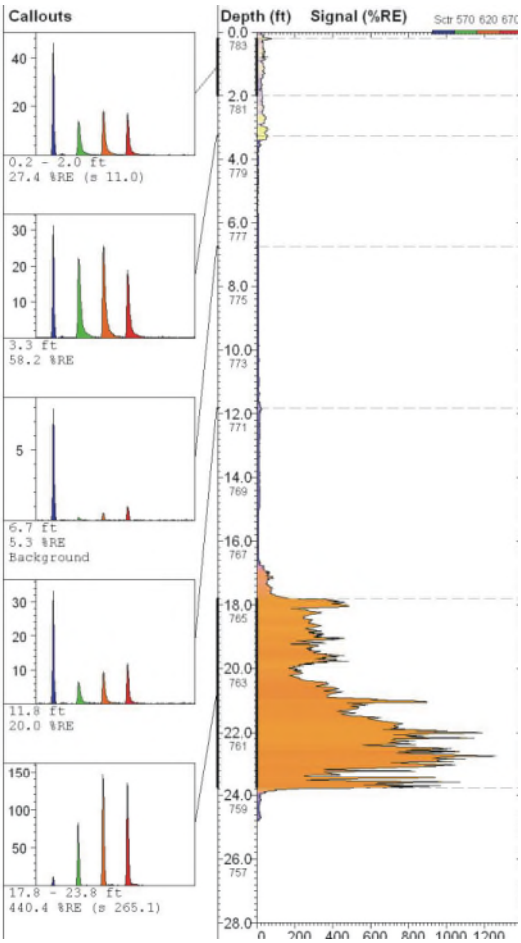

Figure 4. Depth vs %RE and Callouts

B.6 Variability and Preferential Response

NAPLs vary in fluoresce intensity and spectral distribution (color), even NAPLs found at the same site.

Figure 2 illustrates conceptually that TarGOST often responds with varying sensitivity toward different NAPLs, depending on their origin and/or variances in the conditions under which they've been exposed in the decades they've spent in the subsurface. For instance, a thick asphaltine TLM will typically fluoresce much less intensely than a less viscous "runny" OLM. This may well be due to the relative abundance of solvent in one matrix vs. the other. The more solvent available (i.e. the less viscous the NAPL), the higher the likelihood of PAHs being able to emit photons (fluoresce) before a non-radiative mechanism allows the PAH to come back down to the ground state without emitting a photon (quenching).

The preferential sensitivity of TarGOST toward the less viscous (more mobile) OLMs is welcomed by most users, since TarGOST seems to accentuate the presence of the more mobile NAPLs.

It is these more mobile NAPLs that are of the highest regulatory/compliance concern. There is an abundance of anecdotal evidence that suggests that some NAPLs may fractionate in the subsurface into OLM and TLM or even DNAPL and LNAPL. Dakota has participated in a number of investigations where a single NAPL body seems to have 'split' into two distinct NAPLs, with both NAPLs having similar but distinct waveform shapes as we moved away from the suspected release point and they appear to form two separate horizons (a "high" and "low" layer). Although there has been plenty of speculation, the exact mechanism for this phenomenon (if it actually occurs) is not known.

TarGOST uses a green laser to excite the larger (4 -5 rings and higher) PAHs that exist almost exclusively in NAPL form, as opposed to smaller (2-3 ring) PAHs that can more readily partition into the groundwater due to

their much higher solubilities in water. UVOST on the other hand employs ultra-violet (UV) light which can and does excite the smaller 2-3 ring aqueous phase PAHs and sometimes detects (marginally) high concentrations dissolved phase PAHs such as naphthalenes in the groundwater. When this behavior is combined with UVOST's non-monotonic response for many NAPLs, extremely complicated logs are generated that need to be computer analyzed to separate the NAPL fluorescence contribution from that of the dissolved phase. The dissolved phase signals can even surpass NAPL signals, making confident NAPL delineation almost impossible at many sites. This is especially true for those sites with sand/gravel, where pockets of NAPL are perched in or amongst slow-moving or stagnant groundwater.

It should also be mentioned that TarGOST was designed to exclusively detect high concentration PAH NAPLs ("heavies"). TarGOST has, by design, a very limited response (if any) to lighter fuels. While this is often desirable, there are some cases where TarGOST "missing" lighter fuels is undesirable, but this is a limitation of the TarGOST technology.

C Results

Dakota has years of experience using TarGOST. The system has both been fully tested in the lab and in the field.

C.1 Laboratory Testing

Figure 5 illustrates waveforms that are typical of those generated with TarGOST.

If the soil is free of NAPL, the laser scatter channel (leftmost) is far more intense than the three fluorescence channels. The Clean Sand waveform in the figure illustrates what clean (or very low NAPL) soil typically looks like on the TarGOST system. If NAPL is present, the fluorescence channels begin to grow in comparison to the laser channel. The 1,000ppm and 10,000ppm waveforms in the figure illustrate such a condition. Finally, with pure NAPL on the window, the increase in the fluorescence channels is minimal, but there has been significant loss of signal in the laser reflectance channel, due to absorbance by the PAH-laden NAPL.

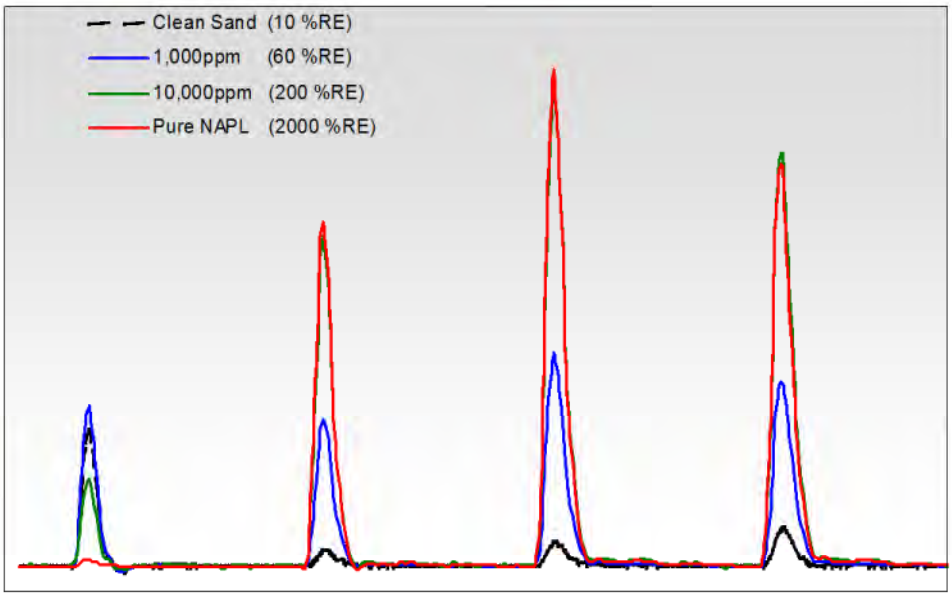

Figure 5. Example TarGOST Waveforms

Lab studies with MGP NAPL on moist Fisher® sea sand (and other soils) consistently demonstrate that TarGOST is capable of linear response vs. NAPL concentration over useful ranges, but some NAPLS are simply better behaved (more/less fluorescent) than others. Figure 6 shows examples of the range we see in TarGOST response for a variety of MGP NAPL on soils.

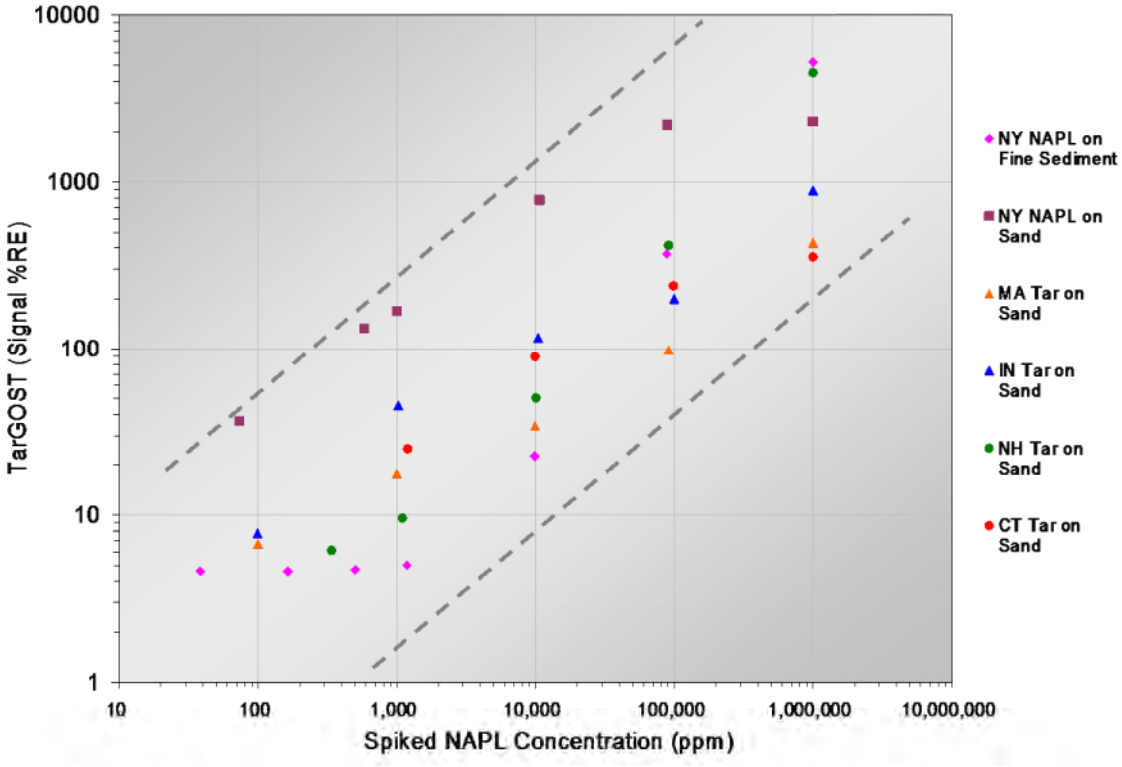

Figure 6. TarGOST response to a variety of MGP NAPLs

C.2 Real-World Data

Dakota has over twenty miles of vertical logging experience using TarGOST. Below are just a few logs of interest gathered over those years.

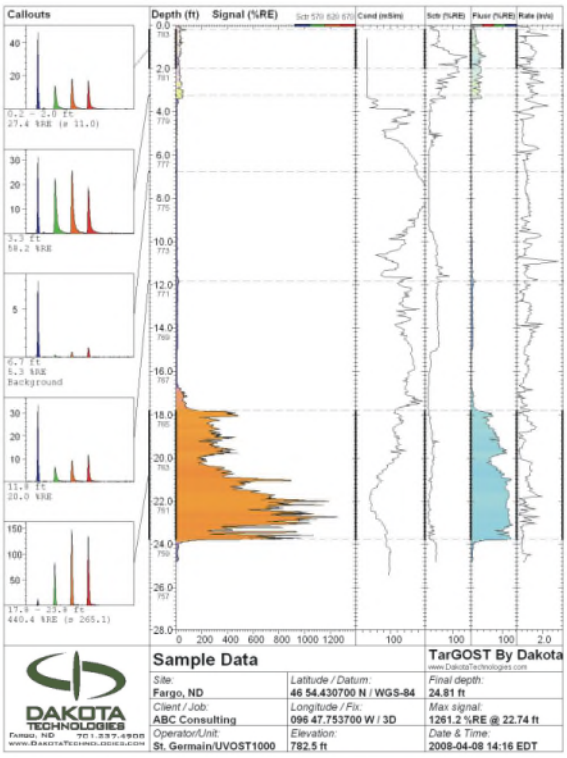

Figure 7. Example Log with EC

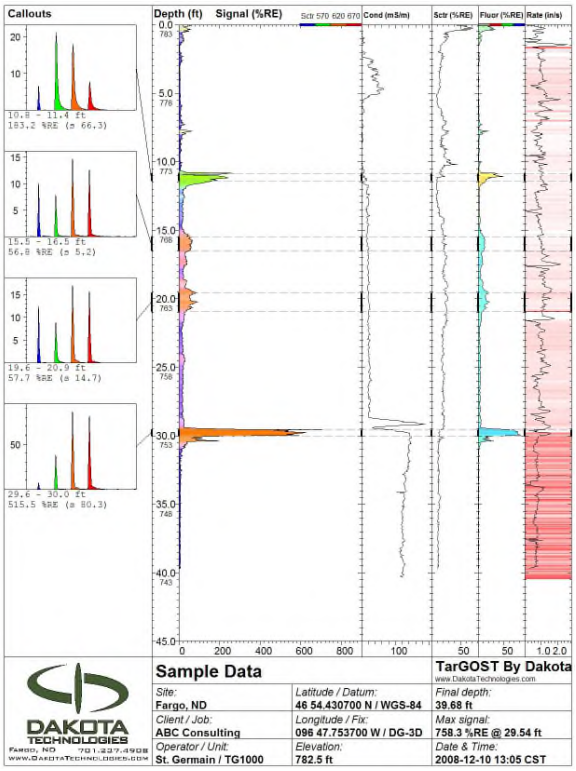

Figure 8. Example data including EC and Hammer Rate (red fill in right panel)

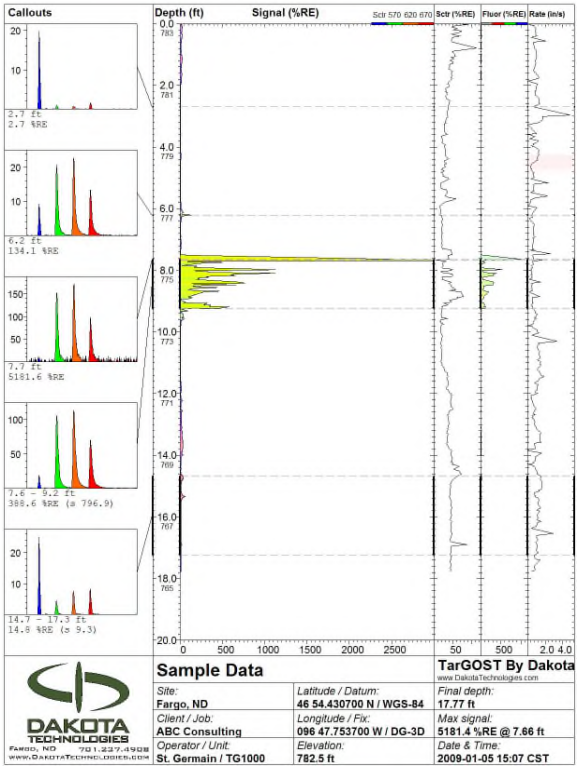

Figure 9. Example data with very high signal (low scatter)

D Theory and Results Summary

The following bulleted list is meant as a quick reference once the underlying principles of operation and results have been examined.

- TarGOST specifically targets the PAHs found in former MGP and creosote NAPLs and DNAPLs. There are most certainly other fluorescent molecular structures beside PAHs that contribute, but the PAHs dominate in most NAPLs
- TarGOST does detect moderate staining and residual levels of NAPL as well as free phase
- TarGOST is completely "blind" to aqueous (dissolved phase) PAHs
- TarGOST is not able to reliably detect "dry" PAHs (dry in the organic solvent sense) that are sorbed to soot, wood chips, and ash. They can generate a small signal but it is often weak and not easily teased out of the background. Many times we're left wondering whether a small signal is caused by very high concentrations of "dry" PAHs on purifier chips or ash/soot or very low (100s of ppm) residual NAPL levels.
- TarGOST's typical lab-determined LOD for NAPL on site soil is 100-500 ppm (weight of NAPL/weight of soil matrix). The more the NAPL fluoresces, the lower the LOD. Note that this is not the same as weight of Total PAHs /weight of soil matrix, since not all of a NAPL is PAHs
- TarGOST does, on occasion, respond to mineral or organic matter enough to be a nuisance. False positives include crushed limestone gravel fill, buried rotting wood/brush debris (the result of major flooding on a gravelly river), sea shells (shell hash), sawdust, quick lime, and some "mystery" solids/soils that were not identifiable
- TarGOST has been observed to significantly respond to peat material , but most peats fluoresce weakly – often there is NAPL in the peat so it's difficult to know for sure whether it's been the peat or NPAL staining that's causing the fluorescence
- TarGOST does not respond to typical lighter end fuels like gasoline or kerosene (diesel can/has been detected) – unless they contain MGP waste or creosote that they are co-mingled in them (pentachlorophenol an obvious example)
- TarGOST is single-point calibrated with a reference emitter (RE) immediately prior to each sounding and the results are always plotted relative to RE (%RE)
- TarGOST calibration/setup isn't perfect and the response for an identical NAPL can vary with optical platform and from lab to field. However, once set up on site, the response remains stable over time and from log-to-log. Changes to the spectrometer and mirror alignment/collimation SOP in 2007 made significant improvements to the consistency of the response
- NAPLs can vary greatly in their fluorescence response – even NAPLs found on the same site from the same source
- Thinner, less viscous NAPLs typically fluoresce much more (x10) than the more viscous TLMs. Asphalt-like TLMs which are solid/plastic fluoresce very poorly
- Scatter-correction is applied to TarGOST data to reduce/eliminate "response rollover" at high concentrations – but at low concentration (<100% RE) the Fluor (%RE) data column is better for judging "hits"
- Color-coding is determined by the relative waveform areas in each channel and provides "at-a-glance" recognition of waveform consistency or changes
- The waveforms contain both quantitative and qualitative information

E On-Site Fundamentals

E.1 Delivery Platform

Dakota has used its TarGOST systems in conjunction with nearly all commonly available direct-push (CPT and percussion) systems on land, ice, and on the water (barge).

- **Dakota's Probe Rig**

Dakota owns a Geoprobe® 5400 direct-push probe mounted on a Ford F-550 truck. When we operate our own system (TarGOST and Geoprobe) we generally send two experienced Dakota technicians.

- **Third Party Rig**

Dakota can rent a probe (for example a track rig) or our customers can hire a third party for the drilling activities. This third party option is generally a good idea when Dakota's mobilization fees are cost prohibitive or a special drilling license is required by the state.

- **Barge**

Dakota has extensive experience working from barges while providing TarGOST services. Barge sizes have ranged from 16' to 150' and we have worked in water depths of a couple of feet to 50'.

E.2 Pre-Planning

- **Free Sample Check**

Dakota will gladly look at your sample and let you know if TarGOST is the right choice for you. If your NAPL doesn't respond well with TarGOST, we'll also test your sample with UVOST to see if it is the better solution. Contact us for details, but it generally involves you sending us jars (from 5 to 40 ml) of your test NAPLs in an unrefrigerated shipping container, along with information regarding your site and contact information. In just a few days we'll let you know the results.

- **Probe Rig**

Arrange for Dakota to probe your site with our self-contained system or hire an outside drilling contractor. Dakota will need to communicate with your potential contractor to determine if they are capable of pushing direct sensing equipment. We have integrated with most Geoprobe models, many AMS probe machines, Marl rigs, homemade probe machines, CME drill rigs, mini CPT skids, tracked CPT machines and several brands of 40 ton CPT trucks.

- **Utility Clearance**

Dakota personnel have been instructed NOT TO PROCEED until underground utilities have been identified. Please communicate with Dakota to ensure that this is completed.

- **Site Access**

If any special security, permits or safety clearance is needed for Dakota's personnel or equipment is needed, alert Dakota prior to us showing up on-site.

- **Transport**

The main components of the TarGOST system are housed in a shock-protected enclosure measuring roughly 2x2x2 feet and weighing approximately 100 pounds. In addition to this enclosure, there is a rod-rack with generally four-foot rods, a computer, fiber cables, a generator, tools, spare probes and various peripheral items. When we ship the system, everything fits in a 4x4x4 foot enclosed pallet. A fork lift and secure storage should be arranged near the work site.

Figure 10. TarGOST and all peripherals in an enclosed palette being loaded for transport

- **Hole Locations**

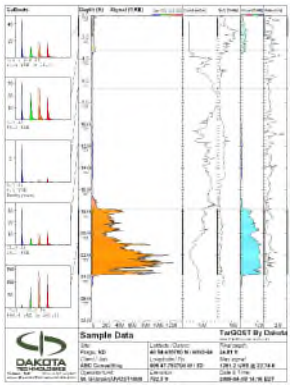
Some customers like to pre-plan the hole locations, mark the site accordingly, and record all relevant x-y and elevation data. A plan of bounding the contamination based on results determined on-site is also viable. Regardless if the hole placement follows a grid or bounding procedure, Dakota strongly prefers to start the job in what is believed to be “the heart” of the contamination. This gives everyone involved a feel for how well the NAPL is going to respond to TarGOST delineation.

- **Sampling**

Dakota recommends discrete sampling at 10% of the hole locations if semi-quantitative values are to be assigned to the LIF signals. Soil sampling can be reduced to approximately 5% of hole locations as a ground-truthing exercise. If an extensive sampling program is planned the client should consider hiring a more cost effective driller. Remember to build sampling time into you scope of work. Do consider getting TarGOST responses to homogenized splits of your samples. If your site has heterogeneous lithology (very typical), the chance of you sampling soils/NAPL that are representative of that which the TarGOST probe passed through are near zero. If heterogeneity exists, and you try to compare lab results to TarGOST %RE of adjacent logs rather than TarGOST %RE of those same samples, the correlation will be terrible (the expected result).

E.3 Daily Production

- **Footage**



TarGOST productivity can range anywhere from 200 to over 500 ft/day. If the pushes are fairly deep (>30 ft), and the obstructions or rubble are minimal, then the average is on the higher end because we spend a lot more time actually probing, not moving around from location to location and/or trying multiple times to get holes started through rubble. Other factors affecting production are grouting requirements, surface pavement, surface topography and vegetation. We typically can log between 10 and 20 locations a day.

- **Start-Up Time**

When the system first arrives on site, it is powered up and tested for proper function. If it is in Dakota's Geoprobe, the TarGOST is simply powered up and we're ready to begin probing after a very short warm-up. If a CPT or other direct-push machine is used, the TarGOST system is integrated into the delivery platform, rods are strung with the Dakota's optical fiber cable and proper depth measuring connections are made (about a 2 to 3 hour procedure).

- **Decontamination**

Typically Dakota uses a rubber rod wiper to "squeegee" any contaminated mud from the probe. If additional decontamination is required, production rates will be impacted accordingly.

- **Sampling**

If Dakota is contracted to collect soil samples, it will be prudent to do all the sampling at one time, preferably at the end of the job. Using LIF data, impacted zones can be identified and targeted for sampling, eliminating the need for continuous cores.

- **Barge Productivity**

TarGOST operations on a barge usually limit daily production to 50 – 200' of logged depth. Additional factors affecting barge productivity are; location accuracy needed, subsurface conditions, water depth and presence of current or tide.

E.4 Deliverables

- **JPEG Images**

Once a log is completed our TarGOST operators can immediately generate an image of the log. Callouts are used to show the waveform from areas of interest. Along with the %RE versus depth plot, the scatter and the fluorescence levels as a function of depth are provided. Secondary data such as the rate of probe advancement, the amount of hammering required to advance the probe with percussion systems, and conductivity may also be available. At the bottom of the log is the pertinent info for the data such as site name and location as well as basic stats such as total depth. These images can be printed on site.

- **Data in Text Format**

Along with the log image, our customers are given the data in ASCII tab delimited format. No string header is provided for the columns (to make importing into other programs easier). Each row is a unique depth reading. The columns are:

1	2	3	4	5	6	7	8	9	10	11
Depth	Total Signal (%RE)	Ch1 (%RE Sctr)	Ch2 (%RE Fluor),	Ch3 (%RE Fluor),	Ch4 (%RE Fluor),	Push Rate	Cond. Depth	Cond. Signal	Hammer Depth	Hammer Rate

TarGOST data collected with a CPT rig will not include the CPT data as that is an independent acquisition system. Dakota is only responsible for providing the LIF data.

E.5 Post-Investigation

- **Customer Care**

Dakota prides itself on going the extra mile from our customers. Whether it is providing detailed information such as this document, or walking the customer through the data on the phone long after we have left the site, we are committed to our customers being well informed and pleased with our service.

- **Hole Locations**

Once Dakota leaves, our customers may wish to survey all the TarGOST locations if it wasn't done prior to the job. Getting good positional information, including elevation, is key to any future CAD and visualization efforts.

- **Conceptual Site Model Visualization**

Dakota now provides the capability to view TarGOST/UVOST/ROST site characterization data in static or dynamic format with unparalleled resolution. Dakota can also overlay the site with aerial photographs or building CAD models over GIS terrain data to provide an accurate overall picture of the site with relevant subsurface features.

» 2-D (fence or cross section) and 3-D models such as Plume and Stick provide a variety of methods to best represent the log data
» Capable of vertical resolution less than 1 inch
» Log interpolation between direct push locations using a highly accurate modeling algorithm
» Choose a variety of display formats including static graphics and dynamic video
» Overlay site aerial photographs or satellite images onto the model
» Integrate Dakota's visual models with client's existing AutoCAD drawings

Notes: Maximum TarGOST responses (RE%) for every two-foot interval are listed in the table above.
TarGOST responses are highlighted on a graded scale: Values over 5% are highlighted lighter yellow to darker yellow as the values increase. At 20%RE and greater, the color scales to orange.
Data from 0 to 10 ft bgs is not evaluated because all locations were hydro-excavated and backfilled with sand and an asphalt patch before data collection.

62	64	--	2.70	--	--	--	--

Notes: Maximum TarGOST responses (RE%) for every two-foot interval are listed in the table above.
TarGOST responses are highlighted on a graded scale: Values over 5% are highlighted lighter yellow to darker yellow as the values increase. At 20%RE and greater, the color scales to orange.
Data from 0 to 10 ft bgs is not evaluated because all locations were hydro-excavated and backfilled with sand and an asphalt patch before data collection.

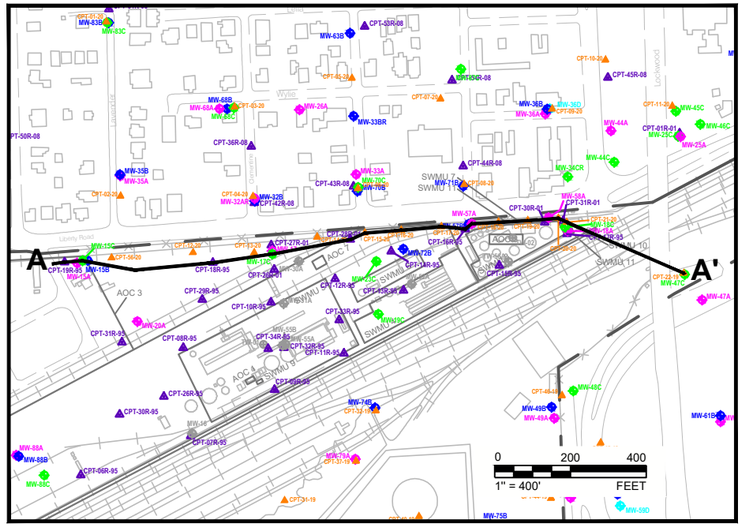
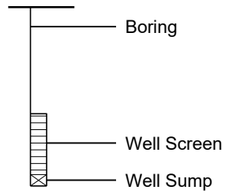
CROSS SECTION LOCATION MAP

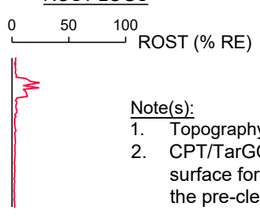


MONITORING WELL CONSTRUCTION



TarGOST LOGS

ROST LOGS



EXPLANATION

Fill: Sand, Silt, Clay & Gravel, wood fragments, bricks, scrap metal

Transmissive Zone (TZ): Sand & Silty Sand

Cohesive Zone (CZ): Clay, Silty Clay & Silt

B-CZ Interbedded Zone B-CZ (IB): Interbedded Carbonate Seams and Calcareous Nodules with Clay & Silty Clay, within the B-CZ

NAPL or Sheen/Staining Noted in Soils for Boring Log, for CPT/ROST Location ROST Result >25% RE, and for CPT/TarGOST Locations TarGOST result >5%RE.[2]

Note(s):

1. Topography is estimated.
2. CPT/TarGOST® locations were pre-cleared to 10 feet below ground surface for utilities and backfilled with sand, TarGOST® data collected in the pre-cleared interval are considered unreliable and are not evaluated.

ATTACHMENT F

Data Usability Summary and Analytical Report – TPH Data

Memorandum

March 9, 2020
Revision: April 23, 2020

To:	Eric Matzner	Ref. No.:	11183954-1620
From:	Chris G. Knight/eew/556-NF	Tel:	512-506-8803
CC:	Jesse Orth, Jon Lang; Julie Lidstone		

Subject: **Data Usability Summary**
TPH Assessment
Union Pacific Railroad (UPRR) / Houston TX-Wood Preserving Works
Houston, Texas
December 2019 – February 2020

1. Scope of Data Usability Study

This document details a Data Usability Summary (DUS) of analytical results for soil samples collected in support of the TPH Assessment at the Union Pacific Railroad (UPRR) / Houston TX-Wood Preserving Works site during December 2019 – February 2020. Samples were submitted to ALS Environmental (ALS), located in Houston, Texas and are reported in data packages HS19120951, HS19121010, HS19121108, HS20011392, HS20011494, HS20020158, and HS20020239. The intended use of the data is to support the TPH Assessment at the site by providing current concentration of chemicals of concern.

Data were reviewed and validated by Chris G. Knight of GHD, in accordance with Title 30 of the Texas Administrative Code Section 350.54 (30 TAC 350.54) as described in the Texas Commission on Environmental Quality (TCEQ) Regulatory Guidance document entitled "Review and Reporting of COC Concentration Data under TRRP", (RG-366/TRRP-13), revised May 2010, herein referred to as "TRRP-13 Guidance". Evaluation of the data was based on information obtained from the chain of custody forms, the finished report forms, method blank data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spikes (MS), the laboratory review checklists (LRC), and the laboratory exception reports (ER).

A sample collection and analysis summary is presented in Table 1. This summary provides a cross-reference of field sample identification numbers and location identification. Each sample is assigned a unique field identification number.

The validated sample results are presented in Table 2. A summary of the analytical methodology is presented in Table 3.

2. Laboratory Qualifications

The Laboratory's quality assurance program is consistent with the quality standards outlined in the National Environmental Laboratory Accreditation Program (NELAP). This laboratory was accredited under Texas Certification number # TX104704231 at the time the analysis was performed and the certificate is included in Attachment A.

i) With the exception of total petroleum hydrocarbons (TPH) by method TX1006, ALS is NELAC-accredited under the Texas Laboratory Program for the analytes, matrices, and methods associated with these laboratory data packages. Because TCEQ does not offer accreditation for these analytes, the results are flagged with "n" in the analytical reports. No further action was required.

3. Project Objectives

3.1 Sampling/Analytical QA/QC Objectives

The QA/QC program was designed to identify contamination resulting from the sampling, sample transport and analytical process through the analysis of method blanks. The QA/QC program was designed to evaluate the quality of the resulting data with respect to bias and precision through analysis of LCS and MS analyses.

4. Data Review/Validation Results

4.1 Sample Holding Time and Preservation

Samples were shipped with a chain of custody and the paper work was filled out properly with the following exceptions:

i) HS19120951– Select sample names were changed from the original chain of custody per client direction. No further action was required.

All samples were delivered on ice and stored by the laboratory at the required temperature (0-6°C).

The sample chain of custody documents and the analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

4.2 Sample Containers

Sample containers used were certified pre-cleaned glass containers provided by the laboratory. These containers meet or exceed analyte specifications established in the United States Environmental Protection Agency (USEPA) *Specifications and Guidance for Contaminant-free Sample Containers*.

4.3 Calibrations

According to the LRC, initial calibration and continuing calibration data met the criteria for the selected method.

4.4 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. As these were not discrete samples handled in the field, these blanks are not listed on the sample identification cross-reference list found in the data packages.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per twenty investigative samples and/or one per analytical batch and results are reported in the laboratory data packages.

The method blank results were non-detect or below the method quantitation limit (MQL), indicating that laboratory contamination was not a factor for this investigation.

4.5 Internal Standard and Surrogate Spike Recoveries

Recoveries of internal standards are addressed in the LRC of the data packages. All internal standard recoveries associated with the compounds of interest were acceptable per the LRC.

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for TPH determinations are spiked with surrogate compounds prior to sample analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project. Each individual surrogate compound is expected to meet the laboratory control limits. According to the TRRP-13 Guidelines, one outlying surrogate is acceptable for methods with multiple surrogate spike compounds as long as the recovery is at least ten percent. Sample analyzed at elevated sample dilutions (five times or greater) were not assessed.

Surrogate recoveries were assessed against laboratory control limits and/or the guidance in TRRP-13. All surrogate recoveries met the above criteria.

4.6 Laboratory Control Sample Analysis

LCS/laboratory control sample duplicate (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project.

For this study, LCS/LCSD were analyzed at a minimum frequency of one per twenty investigative samples and/or one per analytical batch.

The LCS/LCSD contained all analytes specified in the methods. All LCS recoveries and/or RPDs were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision.

4.7 Matrix Spike Analysis

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with known concentrations of the analytes of interest

and analyzed as MS/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision.

MS/MSD analyses were performed as specified in Table 1. The recovery ranges established by the laboratory is adopted as the acceptance criteria for the project.

The MS/MSD samples were spiked with all analytes specified in the methods. All percent recoveries and the RPD value were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision with the following exception:

i) One MS/MSD was reported with elevated recoveries and/or elevated RPDs for TPH determinations due to possible matrix interferences and were not assessed. No further action was required.

The laboratory also performed additional MS/MSD on non-site samples. These cannot be used to assess accuracy and precision for the site samples.

4.8 Field Procedures

Golder Associates, Inc. collected soil samples in accordance with their Standard Operating Procedures (SOP) for sample collection.

4.9 Analyte Reporting

The laboratory reported detected results for each analyte down to the sample detection limit (SDL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the MQL but greater than the SDL were qualified as estimated (J) in Table 2.

The detectability check standard (DCS) results supported the laboratory MDLs.

All soil results were reported on a dry weight basis.

5. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are usable for the purpose of supporting the TPH Assessment at the site by providing current concentration of chemicals of concern in soil samples without qualification.

Work Order: **HS19120951**

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 6 sample(s) on Dec 17, 2019 for the analysis presented in the following report.

This is a REVISED REPORT. Please see the Case Narrative for discussion concerning this revision.

Regards,

CASE NARRATIVE

Work Order Comments

• This report was revised January 28, 2020 in order to adjust select sample IDs per client direction received via email.

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS19120951**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works
WorkOrder:	**HS19120951**

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data								
Laboratory Name: ALS Laboratory Group			LRC Date: 01/10/2020					
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS19120951					
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 148904, 148916, 149362, R353203					
#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X			1
		Were MS/MSD RPDs within laboratory QC limits?		X			2
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				3

Laboratory Review Checklist: Supporting Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 01/10/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS19120951				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 148904, 148916, 149362, R353203				
#[1]	**A[2]**	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?			X		
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist: Exception Reports	
Laboratory Name: ALS Laboratory Group	LRC Date: 01/10/2020
Project Name: Houston TX-Wood Preserving Works	Laboratory Job Number: HS19120951
Reviewer Name: Dane Wacasey	Prep Batch Number(s): 148904, 148916, 149362, R353203

ER#[5]	Description
1	Batch 148916, Texas TPH by Method TX1005, Sample SO-1620-DPT3819(5-6)-20191216, MS/MSD recovered above upper control limits due to sample matrix interference.
2	Batch 148916, Texas TPH by Method TX1005, Sample SO-1620-DPT3819(5-6)-20191216, MS/MSD RPD recovered above upper control limits for >nC12 to nC28 due to possible heterogeneity of the soil matrix.
3	TPH TX 1006: ALS is NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package. Because TCEQ does not offer accreditation for TX 1006, the results are flagged with n.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
mg/Kg-dry	Milligrams per Kilogram- Dry weight corrected

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 4 sample(s) on Dec 18, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: DANE.WACASEY

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS19121010**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X			1
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				2
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				2

Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS19121010				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 148954, 149362, R353367				
#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?			X		
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 8 sample(s) on Dec 19, 2019 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: DANE.WACASEY
Dane J. Wacasey

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS19121108**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 01/13/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS19121108				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 149026, 149028, 149540, R353569				
#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X			1
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X			2
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				3

		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist: Exception Reports	
Laboratory Name: ALS Laboratory Group	LRC Date: 01/13/2020
Project Name: Houston TX-Wood Preserving Works	Laboratory Job Number: HS19121108
Reviewer Name: Dane Wacasey	Prep Batch Number(s): 149026, 149028, 149540, R353569

ER#[5]	Description
1	Batch 149026, TPH by method TX1005, SQ-1620-DPT3419(4-5)-20191218 (HS19121108-03), the surrogate recoveries could not be determined due to dilution below the calibration range.
2	Batch 149026, TPH by method TX1005, sample HS19120963-03, the MS/MSD were performed on an unrelated sample.
3	TPH TX 1006: ALS is NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package. Because TCEQ does not offer accreditation for TX 1006, the results are flagged with n.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 8 sample(s) on Jan 30, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: DAYNA.FISHER

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20011392**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works
WorkOrder:	**HS20011392**

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X				
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				1

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 8 sample(s) on Jan 31, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL
Dane J. Wacasey

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20011494**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

		Were % moisture (or solids) reported for all soil and sediment samples?	X					
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X			
		If required for the project, TICs reported?			X			
R4	O	**Surrogate recovery data**						
		Were surrogates added prior to extraction?	X					
		Were surrogate percent recoveries in all samples within the laboratory QC limits?	X					
R5	OI	**Test reports/summary forms for blank samples**						
		Were appropriate type(s) of blanks analyzed?	X					
		Were blanks analyzed at the appropriate frequency?	X					
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X					
		Were blank concentrations < MQL?	X					
R6	OI	**Laboratory control samples (LCS):**						
		Were all COCs included in the LCS?	X					
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X					
		Were LCSs analyzed at the required frequency?	X					
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X					
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X					
		Was the LCSD RPD within QC limits?	X					
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**						
		Were the project/method specified analytes included in the MS and MSD?	X					
		Were MS/MSD analyzed at the appropriate frequency?	X					
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X					
		Were MS/MSD RPDs within laboratory QC limits?	X					
R8	OI	**Analytical duplicate data**						
		Were appropriate analytical duplicates analyzed for each matrix?	X					
		Were analytical duplicates analyzed at the appropriate frequency?	X					
		Were RPDs or relative standard deviations within the laboratory QC limits?	X					
R9	OI	**Method quantitation limits (MQLs):**						
		Are the MQLs for each method analyte included in the laboratory data package?	X					
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X					
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X					
R10	OI	**Other problems/anomalies**						
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X					
		Were all necessary corrective actions performed for the reported data?	X					
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X					
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				1	

Laboratory Review Checklist: Supporting Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 02/21/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS20011494				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 150266,150790,R356210				
#[1]	**A[2]**	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?			X		
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Reviewer Name: Dane Wacasey	Prep Batch Number(s): 150266,150790,R356210

ER#[5]	Description
1	TPH TX 1006: ALS is NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package. Because TCEQ does not offer accreditation for TX 1006, the results are flagged with n.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL/SDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitaion Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Unit Reported	Description
mg/Kg-dry	Milligrams per Kilogram- Dry weight corrected

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 8 sample(s) on Feb 04, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Generated By: JUMOKE.LAWAL
Dane J. Wacasey

Client:	Golder Associates Inc.	**TRRP Laboratory Data Package Cover Page**
Project:	Houston TX-Wood Preserving Works	
WorkOrder:	**HS20020158**	

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.
Project:	Houston TX-Wood Preserving Works

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X			1
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				2

#[1]	**A[2]**	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?			X		
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Results for: **Houston TX-Wood Preserving Works**

Dear Eric,

ALS Environmental received 14 sample(s) on Feb 06, 2020 for the analysis presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

This data package consists of all or some of the following as applicable:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;

R2 Sample identification cross-reference;

R3 Test reports (analytical data sheets) for each environmental sample that includes:

a) Items consistent with NELAC Chapter 5,
b) dilution factors,
c) preparation methods,
d) cleanup methods, and
e) if required for the project, tentatively identified compounds (TICs).

R4 Surrogate recovery data including:

a) Calculated recovery (%R), and
b) The laboratory's surrogate QC limits.

R5 Test reports/summary forms for blank samples;

R6 Test reports/summary forms for laboratory control samples (LCSs) including:

a) LCS spiking amounts,
b) Calculated %R for each analyte, and
c)The laboratory's LCS QC limits.

R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:

a) Samples associated with the MS/MSD clearly identified,
b) MS/MSD spiking amounts,
c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
d) Calculated %Rs and relative percent differences (RPDs), and
e) The laboratory's MS/MSD QC limits.

R8 Laboratory analytical duplicate (if applicable) recovery and precision:

a) the amount of analyte measured in the duplicate,
b) the calculated RPD, and
c) the laboratory's QC limits for analytical duplicates.

R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.

R10 Other problems or anomalies.
The Exception Report for each "No" or "Not Reviewed (NR)" item in Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory does not hold NELAC accreditation under the Texas Laboratory Accreditation Program.

Client:	Golder Associates Inc.

TRRP Laboratory Data Package Cover Page

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory have been identified by the laboratory in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Check, if applicable: [NA] This laboratory meets an exception under 30 TAC §25.6 and was last inspected by [ ] TCEQ or [ ] _____ on (enter date of last inspection). Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

Dane J. Wacasey

Laboratory Review Checklist: Reportable Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 02/24/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS20020239				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 150420,150437,150896,R356210,R356211				
#[1]	A[2]	**Description**	**Yes**	**No**	**NA[3]**	**NR[4]**	**ER#[5]**
R1	OI	**Chain-of-custody (C-O-C)**					
		Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				
		Were all departures from standard conditions described in an exception report?	X				
R2	OI	**Sample and quality control (QC) identification**					
		Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test reports**					
		Were all samples prepared and analyzed within holding times?	X				
		Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		Were calculations checked by a peer or supervisor?	X				
		Were all analyte identifications checked by a peer or supervisor?	X				
		Were sample detection limits reported for all analytes not detected?	X				
		Were all results for soil and sediment samples reported on a dry weight basis?	X				
		Were % moisture (or solids) reported for all soil and sediment samples?	X				
		Were bulk soils/solids samples for volatile analysis extracted with methanol per SW-846 Method 5035?			X		
		If required for the project, TICs reported?			X		
R4	O	**Surrogate recovery data**					
		Were surrogates added prior to extraction?	X				
		Were surrogate percent recoveries in all samples within the laboratory QC limits?		X			1
R5	OI	**Test reports/summary forms for blank samples**					
		Were appropriate type(s) of blanks analyzed?	X				
		Were blanks analyzed at the appropriate frequency?	X				
		Were method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		Were blank concentrations < MQL?	X				
R6	OI	**Laboratory control samples (LCS):**					
		Were all COCs included in the LCS?	X				
		Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		Were LCSs analyzed at the required frequency?	X				
		Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs?	X				
		Was the LCSD RPD within QC limits?	X				
R7	OI	**Matrix spike (MS) and matrix spike duplicate (MSD) data**					
		Were the project/method specified analytes included in the MS and MSD?	X				
		Were MS/MSD analyzed at the appropriate frequency?	X				
		Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical duplicate data**					
		Were appropriate analytical duplicates analyzed for each matrix?	X				
		Were analytical duplicates analyzed at the appropriate frequency?	X				
		Were RPDs or relative standard deviations within the laboratory QC limits?	X				
R9	OI	**Method quantitation limits (MQLs):**					
		Are the MQLs for each method analyte included in the laboratory data package?	X				
		Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		Are unadjusted MQLs and DCSs included in the laboratory data package?	X				
R10	OI	**Other problems/anomalies**					
		Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				
		Were all necessary corrective actions performed for the reported data?	X				
		Was applicable and available technology used to lower the SDL and minimize the matrix interference affects on the sample results?	X				
		Is the laboratory NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package?	X				2

Laboratory Review Checklist: Supporting Data							
Laboratory Name: ALS Laboratory Group			LRC Date: 02/24/2020				
Project Name: Houston TX-Wood Preserving Works			Laboratory Job Number: HS20020239				
Reviewer Name: Dane Wacasey			Prep Batch Number(s): 150420,150437,150896,R356210,R356211				
#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial calibration (ICAL)**					
		Were response factors and/or relative response factors for each analyte within QC limits?	X				
		Were percent RSDs or correlation coefficient criteria met?	X				
		Was the number of standards recommended in the method used for all analytes?	X				
		Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		Are ICAL data available for all instruments used?	X				
		Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and continuing calibration verification (ICCV and CCV) and continuing calibration blank (CCB)**					
		Was the CCV analyzed at the method-required frequency?	X				
		Were percent differences for each analyte within the method-required QC limits?	X				
		Was the ICAL curve verified for each analyte?	X				
		Was the absolute value of the analyte concentration in the inorganic CCB < MDL?			X		
S3	O	**Mass spectral tuning:**					
		Was the appropriate compound for the method used for tuning?			X		
		Were ion abundance data within the method-required QC limits?			X		
S4	O	**Internal standards (IS):**					
		Were IS area counts and retention times within the method-required QC limits?			X		
S5	OI	**Raw data** (NELAC section 1 appendix A glossary, and section 5.12 or ISO/IEC 17025 section					
		Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		Were data associated with manual integrations flagged on the raw data?	X				
S6	O	**Dual column confirmation**					
		Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively identified compounds (TICs):**					
		If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) results:**					
		Were percent recoveries within method QC limits?			X		
S9	I	**Serial dilutions, post digestion spikes, and method of standard additions**					
		Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method detection limit (MDL) studies**					
		Was a MDL study performed for each reported analyte?	X				
		Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency test reports:**					
		Was the laboratory's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards documentation**					
		Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/analyte identification procedures**					
		Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of analyst competency (DOC)**					
		Was DOC conducted consistent with NELAC Chapter 5C or ISO/IEC 4?	X				
		Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/validation documentation for methods** (NELAC Chap 5 or ISO/IEC 17025 Section 5)					
		Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory standard operating procedures (SOPs):**					
		Are laboratory SOPs current and on file for each method performed?	X				

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist: Exception Reports	
Laboratory Name: ALS Laboratory Group	LRC Date: 02/24/2020
Project Name: Houston TX-Wood Preserving Works	Laboratory Job Number: HS20020239
Reviewer Name: Dane Wacasey	Prep Batch Number(s): 150420,150437,150896,R356210,R356211

ER#[5]	Description
1	Texas TPH by TX1005, sample SO-1620-CPT3719(4-5)-20200206, the surrogates could not be determined due to dilution below the calibration range.
2	TPH TX 1006: ALS is NELAC-accredited under the Texas Laboratory Program for the analytes, matrices and methods associated with this laboratory data package. Because TCEQ does not offer accreditation for TX 1006, the results are flagged with n.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Technical Memorandum - TPH Interpretation

MEMORANDUM

DATE May 11, 2020
Project No. 19119232
TO Michelle Hermiston
Golder Associates, Inc
FROM Brenda Basile
EMAIL brenda_basile@golder.com

INTERPRETATION OF SOIL TX1005 AND TX1006 DATA FOR SAMPLES COLLECTED FROM HOUSTON WOOD PRESERVING WORKS

Samples collected from the Houston Wood Preserving Works (HWPW) facility were analyzed for total petroleum hydrocarbons (TPH) by Texas Method 1005 (Total Petroleum Hydrocarbons, Revision 3). Selected samples were fractioned for carbon range aliphatic and aromatic hydrocarbons by Texas Method 1006 (Characterization of nC_6 to nC_{35} Petroleum Hydrocarbons in Environmental Samples). Chromatograms for 33 samples and the fractionation data for 14 of these samples were reviewed to provide an interpretation of the hydrocarbon types present in the soil samples. Based on the profile of the predominant peaks in the chromatograms and the fractionation data, it is concluded that the soil samples can be assigned four categories:

- nC_6 to nC_{12} Organics
- $>nC_{12}$ to nC_{28} Organics
- $>nC_{12}$ to nC_{28} Organics with High Aromatic Content
- Unresolved complex material (UCM)

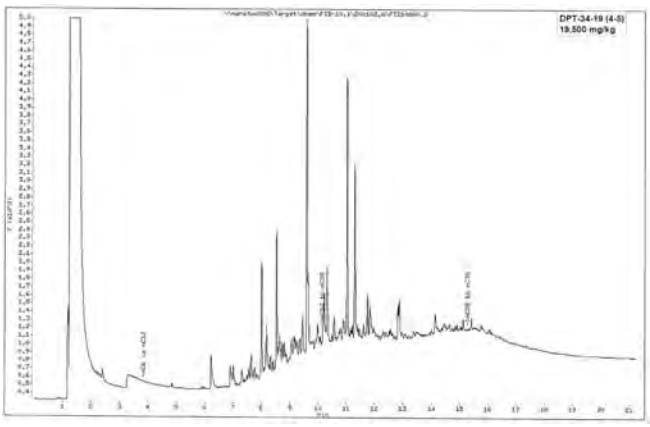
An example chromatogram for each category of hydrocarbon material is provided in this memorandum. Underneath the chromatogram is a list of samples assigned to each category (Tables 1 through 4). The TPH concentrations are provided in the tables. The TX1005 TPH concentrations are listed in Table 5. The percentage fractions in the TX1006 data are listed in Table 6.

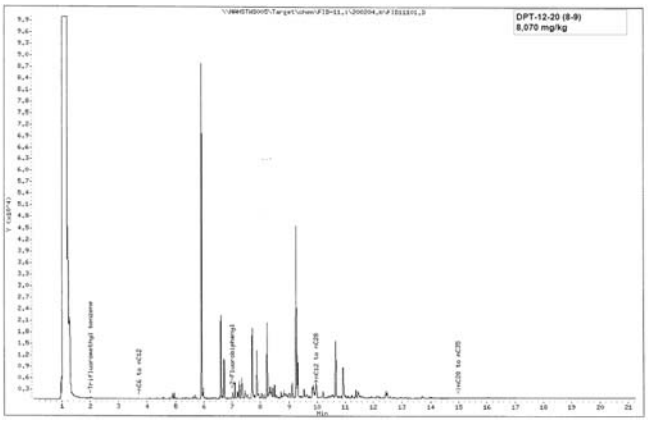
nC_6 to nC_{12} Organics

Samples grouped in the nC_6 to nC_{12} organics category are listed in Table 1. These samples contain chromatographic peaks between the nC_6 to nC_{12} mark on the chromatogram (first red arrow on Figure 1) and the 2-fluorobiphenyl surrogate (second red arrow on Figure 1). While the peaks for the $>nC_{12}$ to nC_{28} range hydrocarbons are also present in the chromatogram, this set of samples is marked by the visual presence of peaks in nC_6 to nC_{12} range. This indicates the presence of volatile organic compounds in the soil at the locations listed in Table 1.

$>nC_{12}$ to nC_{28} Organics

The samples in the $>nC_{12}$ to nC_{28} organics category contain chromatographic peaks in the higher boiling portion of the nC_6 to nC_{12} range and in the $>nC_{12}$ to nC_{28} range (as indicated by the red arrows on Figure 2). The $>nC_{12}$ to nC_{28} organics category is subdivided into two groups based on the percent aromatics in the TX1006 fractionation data (Table 6). The figures below show the visual differences used to categorize the TX1005 chromatograms. The chromatogram on the left below shows an example of a sample categorized as $>nC_{12}$ to nC_{28} while the chromatogram on the right below shows an example of a sample categorized as $>nC_{12}$ to nC_{28} range but with a high (>70%) aromatic content in the fractionation data.

>nC_{12} to nC_{28} Organics	>nC_{12} to nC_{28} Organics with High Aromatic Content
	




The example chromatographic profile in the >nC_{12} to nC_{28} category is shown in Figure 2 and samples assigned to this category are listed in Table 2. The soils at the locations listed in Table 2 may be impacted by diesel or other fuels.

>nC_{12} to nC_{28} Organics with High Aromatic Content

The samples in this category also contain chromatographic peaks in the higher boiling portion of the nC_6 to nC_{12} range and in the >nC_{12} to nC_{28} range but are characterized by a high (>70%) aromatic content in the fractionation data. Figure 3 provides the example chromatogram and Table 3 lists the field sample identifications assigned to this category. The soils at the locations listed in Table 3 may be impacted by creosote. Coal tar creosote, which is used for wood treatment, can contain about 85% polycyclic aromatic hydrocarbons (PAHs) as well as phenols and other compounds (Murphy and Brown, 2005).

Unresolved complex material (UCM)

Samples grouped in the UCM category are listed in Table 4. These samples contain a “hump” of unresolved peaks in the gas chromatogram (as shown by the arc in Figure 4). The components that are separated on the gas chromatographic column appear as the peaks discussed in the first three categories, while the UCM appears as a large hump. A dominance of UCM in the chromatogram is typical of residual fuel oil which have common names such as No. 4, 5, and 6 fuel oils and bunker C. Asphalt and lubricating oils will also have an UCM profile in the gas chromatogram. The UCM composition can be quite variable containing saturated and aromatic hydrocarbons (including PAHs) as well as nonhydrocarbons (heteroatom containing molecules) (TPHWG, 1998).

Risk-Based NAPL Management Technical Memorandum dated August 20, 2020

TECHNICAL MEMORANDUM

DATE August 20, 2020 **Project No.** 19119232

TO Kevin Peterburs, Union Pacific Railroad

FROM Eric Matzner, Golder Associates Inc

RISK-BASED NAPL MANAGEMENT, UPRR HOUSTON WOOD PRESERVING WORKS, HOUSTON, TX

1.0 RISK-BASED NAPL MANAGEMENT, UPRR HOUSTON WOOD PRESERVING WORKS, HOUSTON, TX

Texas Commission on Environmental Quality (TCEQ) guidance document Risk-Based Non-Aqueous Phase Liquids (NAPL) Management - TRRP-32 (TRRP-32 Guidance) (TCEQ, 2013) provides a step-wise process for managing NAPL occurrences at an affected property. An initial NAPL management evaluation was provided in Appendix 11 of the updated APAR addendum dated October 22, 2010 (PBW, 2010) for the Union Pacific Railroad (UPRR) Houston Wood Preserving Works (the Site). The NAPL management process in that initial assessment has been re-evaluated as detailed below to incorporate data from the recent additional NAPL and groundwater assessments conducted at the Site. The following steps were revisited in accordance with TRRP-32 Guidance (TCEQ, 2013):

- Step 1 – Conduct NAPL Assessment (Section 1.1)
- Step 2 – Identify NAPL Response Triggers (Section 1.2)
- Step 3 – Determine NAPL Response Objectives and Endpoints (Section 1.3)
- Step 4 – Develop NAPL Management Strategy (Section 1.4)
- Step 5 – Implement NAPL Management Strategy and Evaluate NAPL Response Effectiveness (detailed in the Revised RAP, August 2020).

1.1 Conduct NAPL Assessment (Step 1)

The additional NAPL assessment (Step 1) was described in the Interim NAPL and Total Petroleum Hydrocarbon (TPH)-NAPL Report dated May 29, 2020 (Interim NAPL Report) (Golder, 2020a) that was submitted to the TCEQ. The objectives of the additional NAPL assessment were to:

- detect, identify, and define extent of NAPL occurrences in the vadose zone, capillary fringe, saturated zone, and surface water/sediments; and
- characterize NAPL occurrences sufficient to identify response triggers.

The additional NAPL assessment consisted of 54 cone-penetrometer testing (CPT)/Tar-specific Green Optical Screening Tool (TarGOST®) laser-induced fluorescence (LIF) borings that were advanced to refine previous assessments of the lateral and vertical extent of Dense NAPL (DNAPL) in the subsurface. TarGOST® borings were advanced in three areas: (1) off-site, generally north of the HWPW Site; (2) along and adjacent to the northern

and western perimeter of the Site; and (3) within the Englewood Intermodal Yard in the Site interior and along the eastern perimeter. The assessment indicated the following for each area:

- Off-Site: There is no evidence of NAPL present off-site to the north of Liberty Road and north of the Site within the A-Cohesive Zone (A-CZ) (vadose zone) or the A-Transmissive Zone (A-TZ). TarGOST® data from off-site borings to the north indicate the presence of NAPL in the B-Cohesive Zone/ B-Transmissive Zone (B-TZ/B-CZ), generally at a depth of 24 feet or more below ground surface (bgs) within the thin carbonate seams within the clay. The northern extent of NAPL in the B-TZ/B-CZ in this area is limited to an approximate distance of 500 feet or less to the north from the Site boundary.
- Northern and Western Perimeter of the Site: The extent of NAPL within the vadose zone, A-TZ, and B-CZ/B-TZ is delineated to the east and west along the northern perimeter of the HWPW Site. TarGOST® signals indicating the potential presence of NAPL in the vadose zone and the A-TZ along the northern perimeter are consistent with historical observations, except at CPT-12-20 and CPT-13-20. Previous CPT-Rapid Optical Screening Testing (ROST™) borings had not identified elevated ROST™ responses in the vadose zone and A-TZ near TarGOST® borings CPT-12-20 and CPT-13-20. At the western perimeter of the HWPW Site, the extent of NAPL within the vadose zone, A-TZ, and B-CZ/B-TZ is delineated to the north, west, and south based on observations in TarGOST® borings, soil borings, and groundwater sampling data. Measurable in-well DNAPL thicknesses have been observed in B-CZ/B-TZ monitoring wells MW-12B and MW-41B on the west side of the Site; however, TarGOST® signals from all but two CPT borings in this vicinity did not indicate the potential presence of NAPL in the B-CZ/B-TZ. These data, coupled with the absence of measurable DNAPL in B-CZ/B-TZ monitoring wells near MW-12B and MW-41B, suggest a very localized area of NAPL in this unit within this area of the Site.
- Englewood Intermodal Yard: TarGOST® data in the Englewood Intermodal (IM) Yard indicate that NAPL is present in the vadose zone (A-CZ), the A-TZ, and the B-CZ/B-TZ, mainly near the former lagoon and former aboveground storage tank (AST) areas identified on historical aerials and maps. The TarGOST® data indicated that the extent of NAPL in each zone in the Englewood Intermodal Yard is delineated to the west, south, and east, where delineation to the north extends into the former HWPW area previously discussed.

Based on the information gathered during the additional NAPL assessment, an updated summary of NAPL occurrence at the Site is presented in the table below (Table 6 of TRRP-32):

	NAPL Occurrence	Description
NAPL in vadose zone	☐ **No NAPL in vadose zone**	There is no direct or indirect evidence of NAPL in the vadose zone
	☒ **NAPL in/on soil**	NAPL detected in or on unsaturated, unconsolidated clay-, silt-, sand-, and/or gravel-dominated soils
	☒ **NAPL in fractured clay**	NAPL detected in fractures of unsaturated fine-grained soils
	☐ **NAPL in fractured or porous rock**	NAPL detected in unsaturated lithologic material
	☐ **NAPL in karst**	NAPL detected in unsaturated karst environment
	☐ **No NAPL in saturated zone or capillary fringe**	There is no direct or indirect evidence of NAPL in the saturated zone or capillary fringe

	NAPL Occurrence	Description
NAPL in saturated zone or capillary fringe	☒ **NAPL at capillary fringe**	NAPL detected at capillary fringe (in contact with groundwater)
	☒ **NAPL in saturated soil**	NAPL detected in saturated unconsolidated clay-, silt-, sand- and/or gravel-dominated soils
	☒ **NAPL in saturated fractured clay**	NAPL detected in fractures of saturated fine-grained soil or other double-porosity soils
	☐ **NAPL in saturated fractured or porous rock**	NAPL detected in saturated lithologic material
	☐ **NAPL in saturated karst**	NAPL detected in karst environment within the saturated zone
NAPL in surface water / sediment	☒ **No NAPL in surface water or sediment**	There is no direct or indirect evidence of NAPL in surface water or sediment
	☐ **NAPL in surface water**	NAPL observed in contact with surface water
	☐ **NAPL in sediment**	NAPL detected or observed in sediment

1.2 Identifying NAPL Response Triggers (Step 2)

NAPL response triggers, as detailed in TRRP-32 Guidance, are used to prompt a risk-based NAPL management response. The following potential NAPL triggers are listed in the TCEQ guidance:

- NAPL Generating Vapors
- Migrating NAPL Zone
- Mobile NAPL Zone
- NAPL Aesthetic Impact or Nuisance Condition
- NAPL in Contact with Groundwater
- NAPL in Contact with Surface Water
- NAPL Contact with Sediment

In the following section, each potential NAPL response trigger and referenced section of the guidance document is evaluated based on site-specific conditions. The purpose of this evaluation is to identify which triggers apply to the NAPL encountered at the Site.

1.2.1 NAPL Generating Vapors Trigger

Trigger Description: This trigger applies to any NAPL occurrence that is generating explosive vapor accumulations in surface or subsurface structures such as underground utility conduits, basements, buildings, storm sewers, and soils in anticipated construction zones. The vapor generation trigger is also applicable to any NAPL occurrence that is generating toxic vapors that are diffusing to the atmosphere in excess of the inhalation PCL $^{Air}Air_{Inh\text{-}V}$ at an applicable point of exposure (POE).

Site Conditions: As discussed in Section 3.2 of the APAR Addendum (PBW, 2009) and Appendix 11 of the updated APAR addendum (PBW, 2010), a survey of the storm water drains along Liberty Road was conducted using an organic vapor meter (OVM)/photo-ionization detector (PID) to evaluate organic vapors and lower explosive limit (LEL) readings from the drains. There were no OVM or LEL readings above background readings in any of the storm drains tested. In addition, the composition of the DNAPL consists of heavy-end, long carbon chain petroleum hydrocarbons with a fraction of lighter, more volatile benzene and toluene. Surface soil samples (defined in the Texas Risk Reduction Program as samples collected from depths of 5 feet below ground surface (bgs) or less) indicate that the more volatile fractions have volatized and are not present in surface soils at concentrations that would generate explosive vapors (i.e., highest benzene concentration detected in surface soil was at 0.21 mg/Kg, well below the $^{Tot}Soil_{Comb}$ PCL of 6.6 mg/Kg, and below levels that might present an explosive concentration).

As detailed in the 2018 Post-Response Action Care Report (PRACR) dated March 29, 2019 (Golder, 2019a), areas of tar-like NAPL surface seeps have been observed within the Englewood IM Yard. In October 2018, test pits were dug in areas where the tar-like NAPL seeps had been observed to evaluate the NAPL in the shallow subsurface. During the test pit excavation, very little odor was observed, and no detectable PID readings were measured when the excavations were scanned with the field PID meter (Golder, 2019a). Additional test pits were constructed in July 2020 in areas of the Englewood IM Yard where the tar-like NAPL has been observed, where the test pits were field screened with a PID and LEL meter. Neither PID nor LEL readings were detected above background at the test pits. This is consistent with the heavy-end petroleum hydrocarbons observed in the Englewood IM Yard area.

Additionally, a soil vapor intrusion assessment was conducted off site north of the Site in 2020. The vapor intrusion evaluation was summarized in the Soil Vapor Intrusion Assessment Interim Report dated March 31, 2020 (updated report dated August 4, 2020) that was submitted to the TCEQ. Based on the vertical separation distance and concentrations of chemicals of concern (COC) in soil gas samples collected for the evaluation, it was concluded that the vapor intrusion pathway is incomplete and NAPL generating vapors trigger was also incomplete.

NAPL Trigger Present? No.

Response Required? No.

1.2.2 Migrating NAPL Zone Trigger

Trigger Description: The migrating NAPL zone trigger applies when NAPL is observed in any environmental medium to have lateral or vertical movement or that exhibits an increasing or changing volumetric footprint over time. Examples of such observations include the appearance of NAPL in previously unaffected borings or monitoring wells, or as NAPL seeps to ground surface or into surface water bodies. However, as stated in the TRRP-32 Guidance, “cyclic NAPL fluctuations (NAPL presence/absence or thickness changes) in impacted wells that penetrate and are completed in the NAPL zone would not be considered evidence of migrating NAPL, but do indicate the presence of mobile NAPL.”

Site Conditions: The sources of DNAPL observed at the Site are likely from spills and drippings at the Site over the 80+ years of operations, with most of the releases likely occurred sometime prior to 1984 when wood preserving operations ceased at the Site. The wood treating facility was dismantled in the mid- to late- 1980s; thus, the DNAPL sources were removed over 30 years ago. The DNAPL plume likely migrated some distance vertically and laterally in the subsurface while the DNAPL sources were present and provided sufficient fluid head to cause DNAPL migration. After the DNAPL sources were removed and the NAPL fluid head subsequently dissipated, the primary

driving force for the DNAPL head has been removed. However, based on the additional NAPL Assessment conducted at the Site as previously discussed and presented in the Interim NAPL Report (Golder, 2020), there appears to be significant secondary source material in the subsurface. Evidence of DNAPL is present in the transmissive zones (A-TZ, B-TZ, and C-TZ) as well as the cohesive zones (A-CZ, B-CZ, and C-CZ). DNAPL migration in the cohesive zones, especially noted in the B-CZ where thin carbonate seams and fractures have been observed containing DNAPL, is driven based on the distribution of the secondary porosity within the clay units and generally follows complex pathways. DNAPL can travel through very small fractures (<20 microns) in clayey units vertically and laterally, where there is low retention capacity (Cohen and Mercer, 1993). As detailed in the Interim NAPL Report (Golder, 2020), the extent of NAPL in the B-CZ off-site based on the field investigations is limited to an approximate distance of 500 feet or less from the Site boundary. The different site conditions applicable to the Site for migrating NAPL detailed in the TRRP NAPL Guidance are discussed below.

Site Condition 1 - NAPL in Vadose Zone < 15 ft below ground surface/ NAPL discharge to ground surface

NAPL discharge to the ground surface has been observed in the Englewood IM Yard. During the July 2017 quarterly inspection of the capped areas at the Site, a tar-like NAPL was observed surfacing through the joints and cracks in the concrete and asphalt surfaces in the area of parking slots B100 to B109 within the Englewood Intermodal Yard at the Site. Details of the observations were provided in the 2018 PRACR (PBW, 2019). Since the initial observation of the tar-like substance at the surface, weekly inspections of the affected area were conducted. The amount of tar surfacing each week varied depending on the ambient temperatures (i.e., greater amounts of the tar-like substance surfaced during warm weather). Based on historical aerials, the tar-like NAPL appears to surface in areas where the former lagoon and AST area were located prior to the mid-1950s. The volume of tar-like NAPL associated with seeps noted during the weekly inspections in the Englewood IM Yard is generally a small amount, as shown on the photograph below (from May 2020 Monthly Update dated June 2, 2020, (Golder, 2020b)).

Photograph No. 1 – Englewood IM Yard (Slot B101), small amount of tar-like material seeping at asphalt crack, material was removed (May 27, 2020).

To evaluate NAPL in the vadose zone, Golder personnel documented the excavation of four test pits in the areas where the tar-like NAPL was observed in the Englewood IM Yard in October 2018, as detailed in the Monthly Status Update – Soil Cap and Concrete Cap Repairs dated October 31, 2018 (October 2018 Monthly Update) (Golder, 2018) submitted to the TCEQ. Four test pits were excavated to the dimensions of approximately 2 feet wide, 6 feet long and 5 feet deep with a mini excavator. The seeps appear to be a result of the volume of the shallow NAPL within the top 3 feet bgs mobilizing during warm weather and, to relieve subsurface pressure, finding preferential pathways to the surface through the concrete pavement's expansion joints and through the cracks in the asphalt pavement. The NAPL observed in each test pit visually appeared to be similar at each location and was described as a black, viscous material found within the top 3 feet bgs. The NAPL, whose physical characteristics are different compared to the DNAPL found in the groundwater bearing units (GWBUs), appeared to flow into the test pits slowly like a paste.

Using the information gathered from the test pits, UPRR implemented an interim response action to address the seeps by installing a NAPL Collection System. The system installation process entailed removing a section of asphalt or concrete cover, excavating the underlying soils, backfilling with high permeability fill, installing slotted pipe to allow the accumulation of NAPL and backfilling the remaining few feet with compacted selected fill and reinforced concrete. Details of the NAPL Collection System installation were provided to the TCEQ in the Response Action Completion Report (RACR) dated March 29, 2019 (Golder, 2019b). The NAPL Collection System was installed in January-February 2019. During the construction activities, the paste-like NAPL was observed within the top few feet below the concrete pavement and would slowly flow into the excavation (see Photograph No. 2 below). Since the installation of the NAPL Collection System, no tar-like NAPL seeps have been observed within the NAPL Collection System area. However, in areas outside the NAPL Collection System, very small amounts of tar-like material have been noted seeping through cracks and joints in the concrete pavement in slots B096, B101, B102, and B105, as well as A010, A021 where previous seeps have been observed. Approximately less than 1 gallon of the tar-like NAPL was recovered from these small seep areas during June 2020 (Monthly Status Updated – June 2020, Golder, 2020).

Photograph No. 2 – A seam of NAPL material encountered on the north wall of the large excavation for the NAPL Collection System, Englewood IM Yard (Slots B104-B105) (January 24, 2019).

Based on these observations, it is concluded that Site Condition 1 (Migrating NAPL in the vadose zone or discharging to the ground surface) is present within the Englewood IM Yard.

For NAPL observed in the vadose zone less than 15 feet bgs, elevated TarGOST® signals were detected in the vadose zone within the Englewood IM Yard (CPT-29-19, CPT-30-19, CPT-32-19, CPT-35-19, and CPT-42-19 (Golder, 2020). Many of these TarGOST® borings were located within the footprint of the former lagoon area identified on historical aerials and maps of the Englewood IM Yard. As discussed in the RAP Revision 0 (PBW, 2014), previous ROST™ borings and soil borings conducted in the HWPW area indicated the presence of NAPL in the vadose zone extending from the HWPW Site into the Englewood IM Yard. However, most of the A-TZ monitoring wells completed within these areas (MW-77A and MW-79A) do not have NAPL accumulating in the wells, indicating the lack of NAPL zone migration from the vadose zone. One exception to that is recovery well MW-78A, which is also located in this area and is completed to a depth of approximately 25 feet bgs. The boring log for this well noted that creosote saturation was observed between 22.8 to 23.8 feet bgs, indicating that the well penetrated and was completed within the NAPL zone. DNAPL has been measured in and recovered from the well since its installation in May 2014. From July 2014 through May 2019, DNAPL thicknesses in Well MW-78A generally decreased, with increasing thicknesses observed from May 2019 through December 2019, and then sporadic thicknesses measured since (2nd Quarter DNAPL Report (Golder, 2020d)). With the long period of steadily decreasing DNAPL thicknesses followed by increasing and then sporadic DNAPL thickness levels in MW-78A, these fluctuations are not likely from migrating NAPL from the vadose zone but rather from mobile NAPL within the A-TZ.

For areas within the HWPW Site, elevated TarGOST® signals from the NAPL Assessment indicating the potential presence of NAPL were observed in the vadose zone along the northern perimeter of the Site (CPT-12-20, CPT-16-20, CPT-17-20, and CPT-21-20) (Golder, 2020a). The highest TarGOST® signal in the vadose zone along the northern perimeter was observed at CPT-16-20 at 10 feet bgs (see Figure 2 in the Interim NAPL Report ((Golder, 2020a)). Four A-TZ monitoring wells (MW-17, MW-18A, MW-57A, and MW-58A) located in this area near or along the northern perimeter have either had no DNAPL measured (MW-18A and MW-58A) or no DNAPL measured since February 2009 and January 2015 for MW-17 and MW-57A, respectively. These data indicate that if there were migrating NAPL in the vadose zone into the underlying A-TZ in this area, the DNAPL thicknesses would likely show on-going increases in NAPL thickness in the A-TZ wells. As such, it is concluded that Site Condition 1 (migrating NAPL in the vadose zone) is not present in this area of the Site.

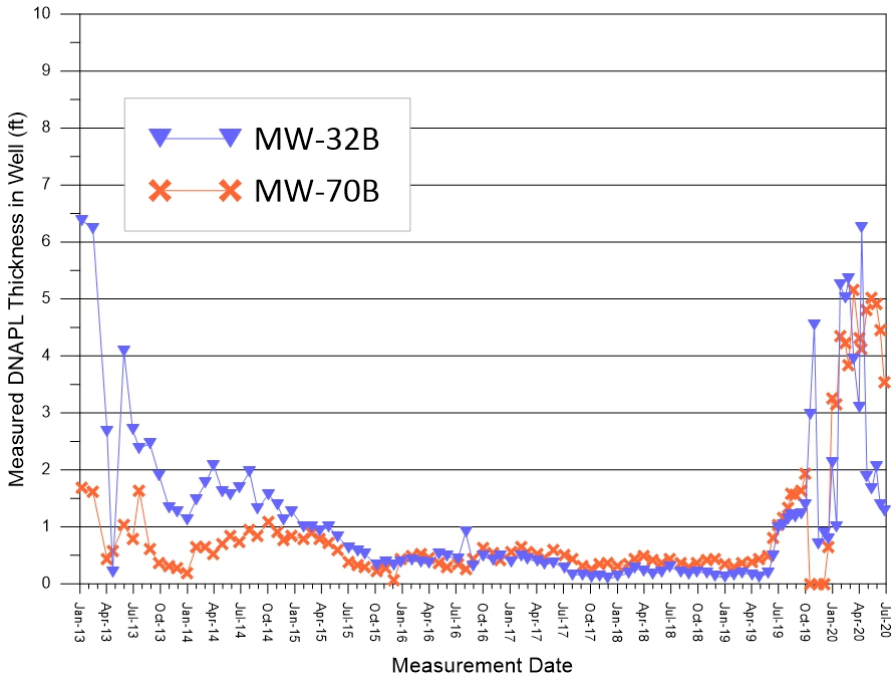
Site Condition 2 - NAPL in saturated zone, not in PMZ (off-site) / NAPL Zone Migration in the Vadose Zone or Saturated Zone

Based on the revised Response Action Plan (RAP) (Golder, August 2020e), a plume management zone (PMZ) is proposed to cover the areas where on-site and off-site (within the City of Houston ROW) groundwater Protective Concentration Level Exceedance (PCLE) Zones are present. However, the following information is for the areas off-site where a PMZ has not been established.

As detailed in the Interim NAPL Report (Golder, 2020a), there is no evidence of NAPL present off-site to the north of Liberty Road and north of the Site within the A-CZ (vadose zone) or the A-TZ. There are 12 A-TZ monitoring wells installed off-site to the north of the Site, where NAPL has not been detected in the A-TZ. TarGOST® data from off-site borings to the north suggest that the shallowest indication of NAPL in this area is in the B-TZ/B-CZ, generally at a depth of 24 feet or more below ground surface (bgs). In addition, DNAPL as indicted by the elevated TarGOST® data, as well as observations from monitoring well soil borings and previously collected ROST™ data,

has been typically associated with the thin carbonate seams and sand-lined fractures within the B-CZ clay. Hydraulic testing conducted in 2009 through 2012 indicated that wells completed in the B-CZ unit have an average hydraulic conductivity of 2 x 10-7 cm/sec (PBW, 2015), indicating that the B-CZ should be considered saturated soils instead of a GWBU. The extent of NAPL in the B-TZ/B-CZ in this area is limited to an approximate distance of 500 feet or less to the north from the Site boundary.

Off-site B-CZ wells that have had DNAPL present in them include MW-32B and MW-70B located approximately 100 feet north of the Site. Monthly DNAPL recovery activities were initiated at these two wells in 2013. From late 2014 through June 2019, monthly DNAPL thicknesses had decreased and were relatively stable with slight fluctuations over that time. Beginning in June 2019, the DNAPL thickness in both MW-32B and MW-70B started to show an increase. During the 2nd Quarter 2020, in-well DNAPL thicknesses in MW-32B increased to 6.26 feet in early April 2020, which was the thickest measurement recorded in the well since the beginning of DNAPL recovery efforts in February 2013 (DNAPL Recovery Activities Quarterly Report – 2nd Quarter 2020, (Golder, 2020d)). DNAPL thicknesses since then have fluctuated between 1.28 feet and 2.05 feet from late-April to late-June 2020. DNAPL thicknesses in MW-70B in early 2020 increased to levels fluctuating between 3.14 feet and 5.15 feet thick, which are some of the thickest measurements observed in the well. Since mid-May 2020, DNAPL thickness has decreased from 5.02 feet to 3.53 feet at the end of June 2020, as shown on the following Graph No. 1. However, similar to the previous discussion on MW-78A, both MW-32B and MW-70B penetrate into and are completed within the observed NAPL zone as described in their respective boring logs (MW-32B – well screened from 26 ft to 36 ft bgs,"small amount of NAPL seeping out of sand-lined fractures 34-34.8 feet, strong odor"; MW-70B – well screened from 25 to 35 feet bgs, "thin carbonate seams at 30.5, 32.2, and 33.2, strong odor, no visible NAPL" [however, DNAPL accumulated in well within about a month following initial well development indicating the presence of NAPL]). As a result, the NAPL fluctuations are not indicative of migrating NAPL, but rather of mobile NAPL within the complex network of fractures and thin carbonate seems of the B-CZ.



Graph No. 1 – DNAPL Thickness over time, MW-32B and MW-70B

At the distal end of the observed NAPL zone in soil borings off-site, monitoring wells MW-68A, MW-68B, and MW-68C are located about 300 feet north of the HWPW site at Clementine and Wylie Streets. During the drilling in June 2010 for monitoring well MW-68C completed in the C-TZ, the field geologist noted an interval of sand to gravel-size calcareous nodules within the B-CZ clay around 35.9 to 36.7 feet below ground surface (bgs) with a petroleum hydrocarbon sheen and NAPL. There were also elevated PID readings in that same interval (~33-37 ft bgs), as shown on the boring log for MW-68C (see RAP Version 0, PBW, 2014). Monitoring well MW-68B was installed nearby MW-68C on December 15, 2011 using sonic drilling techniques to a depth of 38 feet bgs. During the drilling of the borehole for the well, the field geologist noted that there was “sand lined fractures common from 33.5-35 feet, sand is stained with NAPL from 34.5 to 35 feet.” See Photograph No. 3 below showing the 34.5-35-foot interval. Monitoring well MW-68B was screened from 28 feet to 38 feet bgs (see RAP Version 0, PBW, 2014).

Photograph No. 3 – Soil core from installation of MW-68B, showing depth interval 34.5 to 35 feet bgs, note sand-lined fractures (gray color) within clay (reddish-brown). (December 15, 2011).

No DNAPL had been measured in monitoring well MW-68B from the date of installation in 2012 through January 2020; however, some of the highest benzene concentrations detected in groundwater samples from the Site have been detected in this well, especially shortly after the well was installed in 2012, as summarized in the following Table 1. In addition, naphthalene concentrations detected in this well were well above 10% of naphthalene solubility and approached the solubility limit (31 mg/L – TCEQ TRRP Chemical/Physical Properties Table, November 2019) in 2013, further indicating the presence of NAPL in the B-CZ at this location.

Table 1 - Benzene and Naphthalene Concentrations – MW-68B

Well	Sample Date	Benzene (mg/L)	Naphthalene (mg/L)
Residential Assessment Level		5.00E-03	4.90E-01
MW-68B	2/16/2012	2.7	14
MW-68B	7/16/2012	2.4	26
MW-68B	2/6/2013	2.4	12
MW-68B	8/8/2013	2.9	31
MW-68B	1/22/2014	1.5	17
MW-68B	07/24/2014	2.18	10.5
MW-68B	1/29/2018	2.1	9.2
MW-68B	3/21/2018	1.4	12
MW-68B	6/6/2018	1.9	23
MW-68B	1/15/2019	2	5

Well	Sample Date	Benzene (mg/L)	Naphthalene (mg/L)
Residential Assessment Level		5.00E-03	4.90E-01
MW-68B	7/18/2019	1.4	9.6
MW-68B	01/23/2020	1.4	12

Note: Naphthalene solubility is 31 mg/L. Concentrations greater than 10% solubility (>3.1 mg/L) can be an indicator of NAPL

DNAPL was first measured within MW-68B on January 15, 2020 with an in-well thickness of 3.04 feet. DNAPL was recovered from the well on January 15, 2020 and the well has since been incorporated into the DNAPL recovery well network. From January 15 through June 25, 2020, the in-well thicknesses have decreased to 0.86 feet and approximately 2.1 gallons of DNAPL have been recovered. As detailed in the Interim NAPL Report (Golder, 2020a), TarGOST® signals at CPT-03-20 located approximately 25 feet from MW-68B were between ~5 and 9%RE over the depth interval from approximately 29 to 32 feet bgs. The relatively low TarGOST® signals at CPT-03-20 are anomalous when compared to other CPT/TarGOST® locations that were advanced near wells with DNAPL present. This anomaly may be due to isolated pockets of DNAPL within the complex network of thin calcareous nodule seams and fractures in the clay, as noted on the boring log for MW-68B. Even though DNAPL has now been detected in monitoring well MW-68B, the presence of DNAPL was observed within the B-CZ approximately 10 years ago suggesting that the recent observations of NAPL in the well are the result of slow accumulation of mobile NAPL from the surrounding soil (as noted in the soil boring log) into the well rather than an indication of a migrating NAPL zone..

Based on the above discussion, it is concluded that Site Condition 2 for migrating NAPL present in the saturated zone (not within the PMZ) is not present since NAPL fluctuations in the off-site wells are indictive of a mobile NAPL zone and not of a migrating NAPL zone.

Site Condition 3 - NAPL in Saturated Zone in PMZ

As detailed in the Revised RAP (Golder, 2020f), the areas where DNAPL has been observed within the Site and the City of Houston ROW will be included within the PMZ. A discussion of the site conditions for the NAPL in the saturated zone in the PMZ is provided below.

A-TZ:

The majority of the elevated ROST™ readings and TarGOST® signals in the A-TZ were located in and around the former HWPW process areas (SWMUs 4, 5, and 8), and extended south into the northern portions of the Englewood IM Yard (see EVS Technical Memorandum (Golder, 2020x) and Interim NAPL Report, (Golder, 2020x)). The elevated ROST™ readings were generally consistent with intervals where NAPL was visually observed in soil borings for A-TZ wells, except for in the Englewood Intermodal Yard area. NAPL was noted on the boring logs for A-TZ wells MW-78A and MW-79A installed in the Englewood Intermodal Yard, but elevated ROST readings were not observed. The TarGOST® signals in the Englewood IM Yard better represent the areas where NAPL had been noted in soil borings. This may indicate that the NAPL in the Englewood IM Yard may be more degraded, and as a result was less likely to be detected with the ROST™ tool. The highest TarGOST® signals in the A-TZ anywhere at the Site were generally detected in the northern section of the Englewood IM Yard (see Figure 3, Interim NAPL Report, Golder 2020a).

Even though the TarGOST® signals indicate NAPL present in the A-TZ, accumulation of NAPL into wells completed across the A-TZ in these areas where elevated TarGOST® signals are found is not a given. As an example, during installation of monitoring wells in the A-TZ, DNAPL (free-phase or sheen) was observed in soil borings within the A-TZ GWBU in six of the monitoring wells (MW-17, MW-18A, MW-57A, MW-58A, MW-78A, and MW-79A) generally located in the northeast portion of the Site and extending south into the Englewood Intermodal Yard. Of these wells, currently there is only one well, MW-78A, completed in the A-TZ, that has DNAPL routinely present. DNAPL had historically been observed in MW-57A but has reduced to not detected since 2015 following approximately two years of monthly recovery event. The other four wells where DNAPL was noted in the boring logs have not had DNAPL accumulate in the wells.

As another example, monitoring well MW-79A was installed in 2014 and is located in the Englewood IM Yard within the area of the highest TarGOST® signals found anywhere at the Site in the A-TZ. The field supervisor who described the soil core during the installation of this well observed that the A-TZ sand unit was “saturated with creosote from 22.0’ to 27.0’.” Photographs of this interval of the A-TZ show the saturated portion of the sand (see Photograph No. 4 below). However, from 2014 through July 2020, no DNAPL had accumulated or been measured in MW-79A.

Photograph No. 4 – View of soil core from MW-79A, core on the left is from 20 to 30 ft bgs, note creosote saturation in bottom half of sand (22-27ft) (May 7, 2014).

This phenomenon has been observed at numerous wells within the source areas at the Site (MW-30A (plugged), MW-31A (plugged), MW-52A (plugged), MW-55A (plugged), TW-59A (drilled to be a recovery well) (plugged)) where significant NAPL was noted in the boring log when the wells were installed, but no NAPL ever accumulated in the wells. In terms of the TRRP-32 guidance, these are areas where NAPL is considered to be not mobile because it does not flow into a well. Under these conditions, the areas of the A-TZ where the highest ROST™ and TarGOST® signals are located may be indicative of residual saturation of DNAPL or stagnant DNAPL in the sand matrix that is not mobile and thus the NAPL zone is not migrating, especially given the high viscosity of the DNAPL

material. Even though the DNAPL is not mobile, the residual NAPL, trapped within the soil pore spaces, can continue to serve as a source mass for dissolved-phase COCs into the A-TZ.

B-CZ/B-TZ:

The TarGOST® signals indicating potential NAPL were observed in the B-CZ/B-TZ along the northern perimeter of the Site. Elevated TarGOST® signals in the B-CZ/B-TZ were detected in the upper portions of the B-CZ immediately underlying the A-TZ, and throughout the B-CZ generally between 24 and 34 feet bgs, between 34 and 42 feet bgs, and as deep as between 50 and 56 feet bgs. DNAPL had been noted in the B-CZ/B-TZ on the boring logs for wells MW-17C, MW-23C, MW-57B, and MW-72B (Interim NAPL Report, Golder, 2020a). However, for the two wells listed above completed in the B-CZ, MW-57B and MW-72B, no measurable DNAPL has been detected in MW-57B since 2016 and DNAPL has not been observed in MW-72B since installation in 2011. This data indicates that on-going NAPL zone migration in the B-CZ is limited in this area.

The highest TarGOST® signals encountered at the Site during the 2019-2020 NAPL assessment were detected in B-CZ/B-TZ within the Englewood IM Yard. TarGOST® signals indicating the presence of NAPL were observed from the base of the A-TZ to approximately 40 feet bgs into the B-CZ. The highest TarGOST® signals within that interval were detected at CPT-32-19. Monitoring well MW-74B is located within 20 feet of CPT-32-19 and NAPL was noted on the boring log of MW-74B at 23.5 to 24.3 feet bgs, 25.8 to 26.1 feet bgs, and 29 to 35 feet bgs along fractures in a sandy clay. MW-74B is screened from 25.5 to 36.5 feet bgs. However, similar to some of the A-TZ wells previously discussed, no DNAPL has accumulated in this well since installation in 2011. This indicates that there are areas with significant sources of residual DNAPL trapped in the cohesive units where the DNAPL capillary pressure is not high enough to exceed the groundwater pore entry pressure and therefore is neither migrating nor mobile.

In the Englewood IM Yard along the eastern perimeter, TarGOST® signals at CPT-46-19 indicated that the presence of DNAPL was observed from the base of the A-TZ to approximately 38 feet bgs into the B-CZ. Monitoring well MW-49B is located within 30 feet of CPT-46-19 and screened from 30 to 35 feet bgs. The boring log for this well when installed in January 2009 describes the B-CZ as having “silt lens with NAPL at 30.6-31.0” and “carbonate gravel with NAPL at 32.3-32.4” feet bgs. Well MW-49B penetrates the interval where NAPL was observed in the boring log. DNAPL was measured in MW-49B in January and July 2013 (1.19 feet and 0.84 feet, respectively), was not observed in the well from 2014 through 2019, and then measured in July 2019 (0.24 feet). During the January 2020 semi-annual monitoring event, the measured in-well thickness of DNAPL in MW-49B was approximately 14.77 feet. Well MW-49B was added to the DNAPL recovery well network and recovery efforts began in mid-January 2020. DNAPL thickness decreased to 5.47 feet thick by the end of the 1st Quarter 2020 as a result of the bi-weekly recovery efforts. During the second quarter of 2020, DNAPL thicknesses fluctuated between 2.81 feet and 3.82 feet, and approximately 1.6 gallons of DNAPL were removed (DNAPL 2nd Qtr. 2020 Report, Golder, 2020d). Similar to the previous discussion of wells where NAPL thickness fluctuations have been observed, the changes in NAPL thickness in MW-49B are likely a result of mobile NAPL within the complex network of fractures and thin carbonate seems of the B-CZ

As discussed in the Interim NAPL Report (Golder, 2020a), TarGOST® signals in the B-CZ and B-TZ did not indicate a significant secondary source of NAPL on the west side of the Site. In addition, of the 13 CPT/ROST™ locations previously advanced along the western perimeter of the Site, only one location (CPT-19R-01) had a ROST™ response that indicated the presence of NAPL in the B-TZ/B-CZ (PBW, 2014). However, DNAPL has

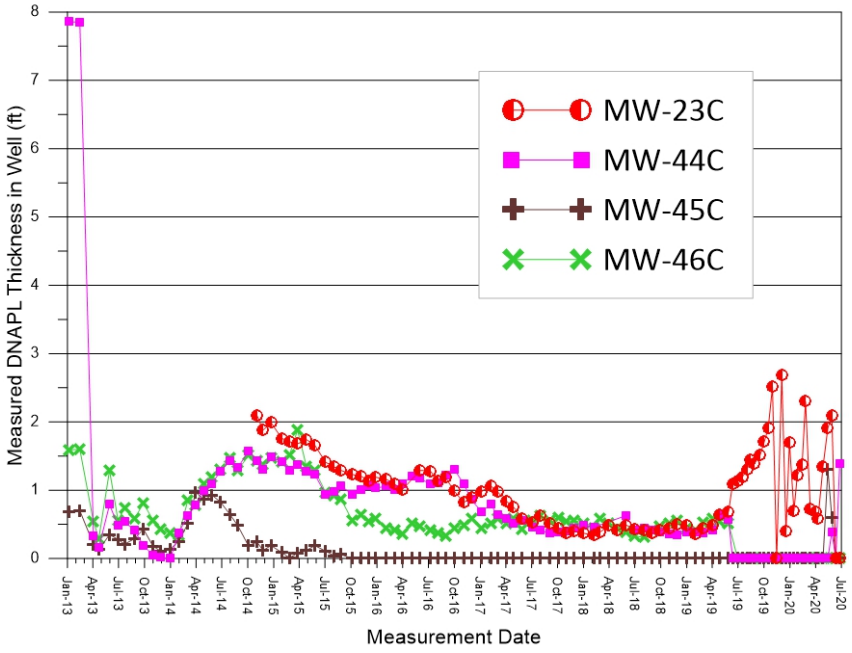
been observed in two monitoring wells MW-12B and MW-41B with some of the thickest in-well measurements of DNAPL observed at the Site (MW-12B with >20 feet thick and MW-41B with >6 feet thick in October 2019). These data, coupled with COC concentrations below applicable PCLs (Golder, 2020) and the absence of measurable DNAPL in the six other B-CZ/B-TZ monitoring wells in this vicinity (MW-39B, MW-38B, MW-62B, P-11, and MW-42B), suggest a very localized NAPL zone in the B-TZ that is not migrating within or from this area.

C-TZ

None of the CPT/TarGOST® borings were able to be advanced through the C-TZ (Golder, 2020a). Of the 100 CPT/ROST borings previously conducted at the Site, only 13 CPT/ROST borings were advanced to the top of the C-TZ. The elevated ROST responses for the borings that could be advanced into the C-TZ were relatively lower than the shallower GWBUs and were generally centered near SWMU 5 (Original Process Area). There are five C-TZ monitoring wells that have had DNAPL measured in them: on-site MW-23C and off-site wells (within the City of Houston ROW and proposed off-site PMZ) MW-34C, MW-44C, MW-45C, and MW-46C. Monitoring well MW-34C was plugged and abandoned and replaced with MW-34CR in 2014. Since its installation, no NAPL has been observed in MW-34CR. Monthly DNAPL recovery activities were initiated at the C-TZ wells in 2013.

From late 2014 through June 2019, monthly DNAPL thicknesses in the C-TZ wells had decreased and were relatively stable around 0.5 feet thick with slight fluctuations over that time. The DNAPL thickness in MW-45C decreased to not measurable beginning in October 2015. Starting in June 2019, DNAPL thickness in MW-23C started to show an increase to greater than 2 feet (historically, DNAPL had been measured greater than 2 feet in 2010 and 2011). Recent DNAPL in-well thicknesses in MW-23C have since fluctuated between 0.58 and 2.68 feet. DNAPL was not detected in MW-23C in mid-June and a trace amount (0.01 feet-thick) was noted in late-June 2020.

For off-site wells MW-44C, MW-45C, and MW-46C, DNAPL thicknesses decreased to not measurable beginning in June 2019 and remained that way until May 2020. In May 2020, DNAPL in MW-44C was measured at 0.39 feet thick and DNAPL in MW-45C was measured at 1.3 feet and 0.6 feet thick. However, DNAPL thicknesses measured in MW-44C may not be accurate given the well had silted up and requires redevelopment (planned for July 2020). DNAPL was not detected in MW-45C in June 2020. For MW-46C, no measurable DNAPL has been observed since June 2019 (trace DNAPL noted in mid-June 2019). (DNAPL Recovery Activities Quarterly Report – 2nd Quarter 2020, (Golder, 2020d)). A graph presenting the DNAPL thicknesses in the C-TZ wells is provided below on Graph No. 2.



Graph No. 2 – DNAPL Thickness over time, C-TZ wells

Similar to the previous discussion of wells where NAPL thickness fluctuations have been observed, the changes in NAPL thickness in these C-TZ wells are likely a result of mobile NAPL and not indicative of migrating NAPL. In summary, the following areas may indicate migrating NAPL zone:

- NAPL in Vadose Zone < 15 ft below ground surface/ NAPL discharge to ground surface
  - Migrating NAPL surfacing in the Englewood IM Yard

NAPL Trigger Present? Yes (within the vadose zone in the Englewood IM Yard).

Response Required? Yes (see Step 3 (Section 1.3))

1.2.3 Mobile NAPL Zone Trigger

Trigger Description: The mobile NAPL zone trigger applies in the vadose zone when the concentration of a NAPL-forming compound exceeds the unsaturated zone Theoretical Residual Soil Saturation Limit ($Soil_{Res}$). NAPL also is explicitly mobile when it is observed to move in the vadose zone. For example, NAPL flow into a monitoring well within the NAPL zone is considered to imply mobility.

Site Conditions: Using the information presented in the Interim NAPL Report (Golder, 2020a), the total TPH TX1005 concentrations in soil samples collected within the vadose zone within the Englewood IM Yard were compared to the TCEQ Tier 1 $Soil_{Res}$ PCL (10,000 mg/kg) as a possible further preliminary indication of the potential presence of NAPL. Soil borings with at least one soil sample containing TPH TX1005 concentrations above the Tier 1 $Soil_{Res}$ were detected in the general area of the former lagoons and within the area of the former ASTs within the Englewood IM Yard and typically found in the top six feet bgs. At locations where TPH concentrations were detected greater than 10,000 mg/kg, either NAPL was visually observed or strong hydrocarbon

odors were noted on the soil boring logs. Soil samples were also collected along the northern perimeter of the HWPW portion of the Site; however, the TPH concentrations were less than the Tier 1 SoilRes in those areas.

As previous discussed, tar-like NAPL has been observed seeping to the ground surface within the Englewood IM Yard, generally in the areas where the former lagoon and ASTs were located prior to the Englewood IM Yard being built in the 1950s. Based on the test pits and installation of the NAPL Collection System, the shallow NAPL is typically found within 3 feet of ground surface lying at the base of the fill material on top of the shallow clay (A-CZ). The source of NAPL in these seep areas is thought to be from creosote residuals stored in the former lagoons and from heavy-end fuel oil that may have been released in the former AST area, with both of these NAPLs being possibly mixed. These NAPL surface seeps appear to be pressure driven as a result of the overburden pressures from the concrete pavement and weight of container trailers.

The storm water drainage system at the Englewood IM Yard appears to have been constructed within the former lagoon and AST areas based on historical aerial photographs. It is uncertain if the wastes that may have been stored in the lagoons and releases from the ASTs were remediated prior to construction of the Englewood IM Yard. Based on test pits that were constructed within the Englewood IM Yard in 2018 and 2020 to evaluate the migrating NAPL to ground surface and results of the TPH assessment (Interim NAPL and TPH-NAPL Assessment Report, Golder, 2020), waste materials were encountered in the test pits at depths similar to the underground storm water drainage pipes.

Based on these observations, the following site conditions are present:

- Mobile NAPL Threat to Subsurface Utility or Structure
  - As demonstrated with the test pits conducted in the Englewood IM Yard in October 2018, NAPL can flow into shallow excavations (4 feet deep). In the event subsurface utilities are installed in this area, mobile NAPL could then migrate into the utility. Stormwater drains and conveyance pipes are located in the vicinity on the NAPL in the vadose zone and former lagoons and AST Area.
- Mobile NAPL in Vadose Zone at depth <=15 ft; in Secured/Restricted Facility
  - The Englewood IM Yard is a currently operating, secured and restricted facility. The Englewood IM Yard has a security fence surrounding most of the property with limited access through security entrances/exits. As required in the Revised RAP, warning signs are posted in the area restricting excavation activities to keep from encountering contaminated material. As a result, risk of contact during construction and excavation activities are safeguarded by controlled property access and implementing soil management plans for proposed construction activities as required under the proposed institutional control (Revised RAP, Golder, 2020f).
- Mobile NAPL Overlies Groundwater NAPL Zone in PMZ
  - The area of mobile NAPL in the vadose zone within the Englewood IM Yard overlies areas of existing NAPL impacts in the GWBUs and within the groundwater PCLE zones. With the proposed on-site PMZ, the mobile NAPL area will be within the PMZ boundary.
- Mobile NAPL in Contact with Groundwater.
  - Further discussed under the NAPL in Contact with Groundwater trigger below.

NAPL Trigger Present? Yes.

Response Required? Yes (see Step 3 below)

1.2.4 NAPL Aesthetic Impact or Nuisance Condition Trigger

Trigger Description: The NAPL aesthetic impact or nuisance condition trigger applies when NAPL causes a condition that results in an environmental resource being made unfit for use. This trigger applies if the NAPL presents objectionable characteristics (e.g., taste and odor) in the affected environmental medium or via a cross-media exposure pathway.

Site Conditions: No water wells have been identified in the area. NAPL is in contact with Class 2 groundwater, which is detailed in the following NAPL Trigger. As discussed under the migrating and mobile NAPL discussion, tar-like NAPL has been observed in the top ten feet below ground surface where NAPL surface seeps have been observed at the Englewood IM Yard creating a nuisance condition. The tar-like NAPL was observed in the test pits less than 3 feet bgs where the NAPL would slowly flow (paste-like) into the test pits.

NAPL Trigger Present? Yes.

Response Required? Yes (see response required for Mobile NAPL Trigger).

1.2.5 NAPL Contact with Groundwater Trigger

Trigger Description: The NAPL contact with groundwater trigger applies when NAPL is observed or inferred to be in direct contact with a groundwater-bearing unit (GWBU) or its capillary fringe.

Site Conditions: Data from the monitoring wells, CPT/ROST, and CPT/TarGOST borings indicate that DNAPL and possibly LNAPL are in contact with the Class 2 (A-TZ, B-TZ, and C-TZ) and Class 3 (B-CZ) groundwater bearing units and the capillary fringe at the Site. As previously discussed, NAPL has been observed in the GWBUs on-site (A-TZ, B-TZ/B-CZ, and C-TZ) and off-site (C-TZ) in the area of the proposed PMZs, and off-site (B-CZ) in the areas where a PMZ is not planned at the current time. The presence of NAPL has been confirmed through NAPL observations and recovery activities at some of the monitoring wells. UPRR has been conducting DNAPL recovery activities from wells completed in both Class 2 (A-TZ, B-TZ, and C-TZ) and Class 3 (B-CZ) GWBUs at the Site since 2013. Based on the observations from NAPL gauging and recovery activities (Golder, 2020d), the following site conditions are present for this NAPL Trigger:

- NAPL in Contact w/ Class 2 / Class 3 Groundwater, Not in PMZ
  - As detailed in the Interim NAPL Report (Golder, 2020a), there is no evidence of NAPL present off-site to the north of Liberty Road and north of the Site within the A-TZ outside of the proposed A-TZ PMZ. TarGOST® data from off-site borings to the north indicate the presence of NAPL in the B-TZ/B-CZ that is limited to an approximate distance of 500 feet or less from the Site boundary. Most of the area where the TarGOST® data indicated potential NAPL in the B-CZ is within the area identified as a Class 3 groundwater resource (hydraulic conductivity testing indicates it's a saturated soil per TRRP-8 Guidance). B-CZ monitoring wells MW-32B and MW-70B located off-site and within the area designated as Class 3 groundwater classification have had DNAPL detected in the wells, confirming this site condition.
- NAPL in Contact w/ Class 2 / Class 3 Groundwater, in PMZ

- A-TZ Wells: Two monitoring wells completed in the A-TZ have had measurable DNAPL detected: MW-57A and MW-78A.
- B-TZ/B-CZ: On-site recovery wells MW-12B and MW-41B on the west side, and MW-49B, MW-57B, and MW-75B completed in either the B-TZ or B-CZ have had measurable DNAPL in the wells.
- C-TZ Wells: Wells MW-23C, MW-44C, MW-45C, and MW-46C have had recent detections of NAPL in the C-TZ.

NAPL Trigger Present? Yes.

Response Required? Yes (see Step 3 in Section 1.3)

1.2.6 NAPL Contact with Surface Water Trigger

Trigger Description: The NAPL contact with surface water trigger applies to the release of NAPL to surface water.

Evaluation: There have been no observed releases of NAPL to surface water at or around the Site.

NAPL Trigger Present? No.

Response Required? No.

1.2.7 NAPL Contact with Sediment Trigger

Trigger Description: The NAPL contact with sediment trigger applies when NAPL impacts surface water sediments.

Evaluation: NAPL is not in contact with surface water sediment.

Trigger Present? No.

Response Required? No.

The following is the NAPL Response Trigger and Site Condition Matrix (Table 11 from TRRP-32 Guidance) based on the discussed site conditions.

NAPL Response Trigger and Site Condition Matrix (Table 11 from RG-366/TRRP-32)

NAPL Trigger	Site Condition
❑ **No NAPL Triggers**	❑ **No NAPL triggers have been identified in any assessment zones (vadose, capillary fringe and saturated) nor in surface water or sediment**
❑ **NAPL Generating Vapors**	❑ **NAPL generating explosive vapor accumulations** ❑ **NAPL generating vapors that exceed inhalation PCLs at applicable inhalation POE**
☒ **Migrating NAPL Zone**	☐ **NAPL in vadose zone ≤15 ft below ground surface** ☐ **NAPL in saturated zone, not in PMZ*** ☐ **NAPL zone migration in the vadose or saturated zones** ☒ **NAPL discharge to ground surface, surface water or sediment** ☐ **NAPL in saturated zone in a PMZ***
☒ **Mobile NAPL Zone**	☒ **NAPL threat to subsurface utility or structure** *NAPL proximal to subsurface utility or structure with potential risk of entry* (*not applicable to product/waste transfer lines at refineries, chemical plants*, etc.) ❑ **NAPL in vadose or saturated zone at depth ≤ 15 feet; not in *secured/ restricted facility*** *Risk of contact in uncontrolled construction/excavation* (e.g., *public utility corridors: water, wastewater, telephones*, etc.). ☒ **NAPL in vadose or saturated zone at depth ≤ 15 feet; in *secured/restricted facility*** *Risk of contact during construction/excavation safeguarded by controlled property access* (e.g., *refineries, chemical plants, active military installations, airports*, etc.). ❑ **NAPL overlies unaffected groundwater** *Mobile NAPL in vadose zone not yet contacting saturated zone* ☒ **NAPL overlies affected groundwater in PMZ*** *NAPL in vadose zone above saturated zone in existing or planned PMZ* ☒ **NAPL in contact with groundwater** *NAPL subject to entering installed well or to migration in response to changes of groundwater surface gradient due to pumping or other activities.*
☒ **NAPL Aesthetic Impact or Nuisance Condition**	☒ **Aesthetic impact or nuisance condition at ground surface, surface water, vadose zone, or groundwater** *Always includes NAPL contact with Class 1 groundwater and Class 2 groundwater*
☒ **NAPL Contact with Groundwater**	❑ **NAPL contact w/ Class 1 groundwater** ☒ **NAPL contact w/ Class 2 / Class 3 groundwater, not in PMZ*** ☒ **NAPL contact w/ Class 2 / Class 3 groundwater, in PMZ***
❑ **NAPL Contact with Surface Water**	❑ **NAPL floating on surface water or entrained in surface water body**
❑ **NAPL Contact with Sediment**	❑ **NAPL in or on banks or bed of surface water body**

PMZ – *plume management zone* **POE** – *point of exposure*

***** includes PMZs that have been approved by the TCEQ, PMZ-eligible sites where a PMZ will be proposed to the TCEQ in a RAP, as well as a PMZ via a §350.33(f)(3) Technical Impracticability demonstration.

1.3 Determine NAPL Response Objectives and Endpoints (Step 3)

Based on the above evaluation, four NAPL response triggers were identified:

- Migrating NAPL Zone
- Mobile NAPL Zone
- NAPL Aesthetic Impact or Nuisance Condition
- NAPL in Contact with Groundwater

The NAPL response objectives and endpoints for each of these triggers are discussed below. Table 23 from TRRP-32 Guidance is provided at the end of this section to identify the preliminary NAPL response objective and preliminary endpoints for the identified triggers.

1.3.1 Migrating NAPL Zone Trigger

As detailed in Section 1.2.2, the following site condition for the on-site areas "NAPL discharge to ground surface."

NAPL Response Objective

For the on-site condition under Migrating NAPL Zone, the NAPL response objective according to the TRRP-32 Guidance is to "abate NAPL zone migration." This NAPL response objective will be carried through the on-going evaluation of feasible alternatives for the Englewood IM Yard as discussed in the Revised RAP (August 2020).

NAPL Response Endpoints – On-Site

NAPL discharge to ground surface

As detailed in Section 1.2.2, this site condition is based on tar-like NAPL observed in the top 5 feet and the NAPL surface seeps noted in the Englewood IM Yard. These site conditions fall under the "Recovery Only" recovery endpoint, which states the following NAPL response endpoint as shown on TRRP-32 Table 23:

- NAPL recovered sufficient to eliminate NAPL discharge (NAPL discharge to ground surface).

Based on this recovery endpoint, UPRR has implementing two responses in the Englewood IM Yard to address NAPL Response Endpoint:

1) Installation of the NAPL Collection System as an interim response (detailed in the RACR dated March 2019 (Golder, 2019)); and
2) Conducting weekly site inspections of the tar-like NAPL seep areas and recovering any NAPL that has seeped to the ground surface.

UPRR is continuing to evaluate the areas where NAPL seeps have been observed through conducting test pits (July 2020) in those areas. During test pit construction, NAPL mass is removed from the area of where the NAPL seeps have been observed. Details on continuing responses to address this site condition are provided in the Revised RAP (August 2020).

Monitoring to verify long-term NAPL zone stability will be incorporated into the Remedy Standard B post-response action care requirements for the PMZ until the NAPL recovery can be demonstrated to have achieved residual

saturation concentrations and eliminated NAPL discharge. NAPL properties, distribution or capillary barriers that contribute to NAPL zone stability will be evaluated to facilitate the demonstration.

1.3.2 Mobile NAPL Zone Trigger

The mobile NAPL zone trigger leads to site-specific NAPL response objectives for the vadose zone. As detailed in Section 1.2.3, four site conditions apply under this trigger, all of which are considered within the UPRR property boundary:

- Mobile NAPL threat to subsurface utility or structure
- Mobile NAPL in vadose zone at depth ≤ 15 ft; in secured/restricted facility
- Mobile NAPL overlies groundwater NAPL zone in PMZ
- Mobile NAPL in contact with groundwater

NAPL Response Objectives

As indicated in Table 23 of the TRRP-32 guidance document, the NAPL Response Objectives for the different mobile NAPL zone triggers at the Site include:

Site Condition		NAPL Response Objective
Mobile NAPL threat to subsurface utility or structure	→	Prevent mobile NAPL impact to shallow vadose zone receptors
Mobile NAPL in vadose zone at depth ≤ 15 ft; in secured/ restricted facility	→	Prevent potential exposure to mobile NAPL
Mobile NAPL overlies groundwater NAPL zone in PMZ	→	Prevent NAPL migration to groundwater
Mobile NAPL in contact with groundwater	→	Prevent disturbance of mobile NAPL that could induce migration

NAPL Response Endpoints

Details for each NAPL Response Endpoint Types for the various response objectives are provided below.

Prevent mobile NAPL impact to shallow vadose zone receptors

For areas where mobile NAPL could potentially be a threat to a subsurface utility or structures, TRRP-32 Guidance allows only "**Recovery Only - NAPL recovered to residual saturation**" as the NAPL Response Endpoint unless a TI waiver has been approved. If a TI waiver has been approved, then a Control Endpoint is allowed by preventing access to NAPL zone using a physical control.

Recovery of the tar-like NAPL has been on-going with the installation of the NAPL Collection System and weekly site inspections and NAPL recovery of surface seeps. Additional investigations will be conducted to evaluate the storm water drainage system to assess if any of the shallow NAPL observed in the vadose zone is located near the drainage pipes. Details of the additional investigation activities will be presented in subsequent reports.

Prevent potential exposure to mobile NAPL

As discussed in Section 1.2, the Englewood IM Yard, which is an operating facility, as well as the HWPW portion of the Site are within a secured and restricted facility. The HWPW and Englewood IM Yard have a security fence surrounding most of the property with limited access into the Englewood IM Yard through security entrances/exits. Therefore, the TCEQ TRRP Guidance provides two NAPL recovery endpoints under this site condition:

1) Recovery Endpoint – **NAPL recovered to residual saturation**; and

2) Control Endpoint – **Exposure to NAPL zone prevented via institutional control**.

The preferred response endpoint is through the Control Endpoint. The existing concrete pavement within the Englewood IM Yard was proposed in the RAP (PBW, 2014) as a Remedy Standard B Control or cap to prevent on-site commercial/industrial receptors from being exposed to the shallow soils containing COCs at concentrations greater than the critical PCLs and the mobile NAPL in the top 4 feet bgs.

As required in the RAP, warning signs are posted in the area warning of excavation and encountering contaminated material (see Photograph No. 4 below) and an institutional control will also be implemented. As a result, risk of contact during construction and excavation activities are safeguarded by controlled property access and implementing soil management plans for proposed construction activities. The institutional control in the form of a deed restriction as detailed in the RAP follows the TRRP Guidance that discusses provisions that warns of the potential mobile NAPL, prohibits groundwater pumping in the affected GWBU and drilling/excavation into or through the mobile NAPL zone, and requires any NAPL removed during future subsurface activities to be properly handled and managed in accordance with all applicable state and federal rules and regulations (control endpoint).

Photograph No. 4 – View of warning sign restricting digging/excavation activities in the Englewood IM Yard (July 17, 2017).

Prevent NAPL migration to groundwater

During the operational history and after the former lagoon area and AST area were removed and converted into the Englewood IM Yard in the late 1950s, NAPL released to the environmental in these areas have migrated to the shallow GWBUs (A-TZ and B-CZ) as detailed in the previous discussion on the Migrating NAPL Trigger. The proposed response discussed under that trigger and related NAPL response objective (NAPL in contract with groundwater) is to establish the on-Site PMZ to include this area. However, as noted with the presence of thick, tar-like NAPL in the shallow vadose zone within the Englewood IM Yard, it appears that the natural geology (clay unit within the A-CZ) is preventing continued downward migration of the NAPL to the GWBUs. Given the physical characteristics of the material (i.e., high viscosity) and that the material has been in the subsurface for 70+ years, the NAPL that has been recently observed in the vadose zone (see Photograph No. 2) is not likely to further migrate vertically to the underlying GWBUs. However, the Interim NAPL Assessment (Golder, 2020d) indicated that there is evidence of areas of NAPL saturation from the shallow vadose zone vertically downward to the uppermost GWBU (A-TZ), demonstrating that NAPL migration to groundwater had historically already occurred and effectively obviating the response objective of preventing NAPL migration to groundwater.

Regardless, both recovery and control endpoints are available to address the NAPL response endpoints under this site condition:

1) Recovery Endpoint – **NAPL recovered to residual saturation**; and

3) Control Endpoint – **NAPL zone migration control by physical or natural methods and institutional controls**.

The current endpoint being used in the Englewood IM Yard for this response objective is the Control Endpoint – preventing the disturbance of mobile NAPL zone through physical and institutional controls by restricting excavation activities in the Englewood IM Yard. The surface and subsurface soil PCLE zone and NAPL zone in the Englewood IM Yard area are currently covered with a physical barrier (concrete pavement), preventing contact with NAPL for on-site workers, and provides a cover restricting infiltration. Even though NAPL has been detected in the vadose zone, the NAPL Assessment indicated NAPL saturation from the vadose zone through the uppermost GWBU (A-TZ) In addition to the physical control, the proposed institutional controls include the establishment of the on-Site PMZ, details that in the event construction activities are necessary within the Englewood IM Yard, a health and safety plan will be implemented to ensure worker protection from COCs and NAPL in the surface soils and a soil management plan will be developed if soils are excavated as part of the construction activities. On-going NAPL recovery activities from NAPL Collection System and on-site wells will continue to address the other NAPL triggers. The proposed institutional control in accordance with the TRRP Guidance is provided in the Revised RAP (Appendix 4) (Golder, 2020) for the Site.

Prevent disturbance of mobile NAPL that could induce migration

This response objective to address the site condition mobile NAPL in contact with groundwater is for mobile NAPL in the capillary zone or saturated zone that could be induced to migrate through groundwater pumping or creating artificial penetrations that allow vertical migration into underlying GWBUs. Both the recovery and control endpoints are available to address the NAPL Response Endpoints under this site condition:

1) Recovery Endpoint – **NAPL recovered to residual saturation**; and

4) Control Endpoint – **Disturbance of mobile NAPL zone prevented via institutional controls**.

Similar to the approach for the Prevent NAPL migration to groundwater, UPRR proposes to address this site condition through the Control Endpoint – preventing the disturbance of mobile NAPL zone through institutional controls. The institutional control will include language prohibiting groundwater pumping in the area and prohibiting drilling and excavation activities in the Englewood IM Yard where mobile NAPL is present unless mitigating actions are implemented to prevent disturbance and potential migration on the NAPL into the underlying GWBUs. In addition, on-going NAPL recovery activities from NAPL Collection System and on-Site wells will continue.

1.3.3 NAPL Aesthetic Impact or Nuisance Condition

With the presence of NAPL in the shallow subsurface (in the top 10 feet) and observed surface seeps in the Englewood IM Yard, this site condition creates a TRRP-32 Guidance defined nuisance condition within the Englewood IM Yard both with potential odors from the NAPL when surfacing and impacting the soil integrity in the area. Both the recovery and control endpoints are available to address the NAPL Response Endpoints under this site condition:

1) Recovery Endpoint – **Recover NAPL sufficient to eliminate aesthetic/nuisance condition**; and

5) Control Endpoint – **aesthetic impact or nuisance condition abated with physical control at NAPL zone and/or at POE**.

Similar to the approach for the Mobile NAPL Zone Triggers, UPRR proposes to address this site condition through a combination of recovery and control endpoints. The recovery endpoints will include the on-going NAPL recovery efforts with the NAPL Collection System and weekly inspections. For the Control Endpoint, the NAPL zone in the Englewood IM Yard area is currently covered with a physical barrier (concrete pavement), restricting the aesthetic impact of the NAPL in the shallow soils. In addition, the institutional control placed on the property will include language prohibiting drilling or excavation unless a health and safety plan is implemented to ensure worker protection from COCs and NAPL in the surface soils and a soil management plan is developed. UPRR will continue to address the NAPL surface seeps to address this NAPL response objective, as detailed in the Revised RAP.

1.3.4 NAPL Contact with Groundwater

Two site conditions fall under this NAPL trigger:

- NAPL contact w/ Class 2 / Class 3 groundwater, not in PMZ (off-Site)
- APL contact w/ Class 2 / Class 3 groundwater, in PMZ (on-Site and City of Houston ROW)

For NAPL in contact with groundwater off-Site and thus not in a PMZ, the NAPL response objective is groundwater restoration to the critical PCL. Whereas the response objective for the on-Site PMZ is compliance with PMZ performance criteria at NAPL zone. Both are discussed below.

Groundwater Restoration

As detailed in Section 1.2.4, NAPL has been observed in contact with groundwater off-Site in the Class 3 B-CZ and Class 2 B-TZ GWBU. From 2014 through 2019, an off-site PMZ was proposed for the areas where NAPL is in contact with groundwater off-Site. However, the off-site PMZ was not approved by the TCEQ in 2019 because of failure to obtain landowner consent for the required institutional control for the proposed PMZ area. Therefore, the TCEQ TRRP Guidance provides the recovery only endpoint under this site condition unless a TI waiver has been

approved by the TCEQ. A TI waiver was submitted in the RAP (PBW, 2014, as revised in 2016) in which the TCEQ did not deny the waiver on the technical merits that groundwater restoration is impracticable, but rather did not approve the TI waiver based on concerns of groundwater plume stability within the no-growth PMZ (TCEQ Interoffice Memorandum, TCEQ, 2016). In the event the TI waiver is approved, then the two NAPL response endpoints would be allowed:

1) Recovery Only Endpoint – **Recover soluble NAPL fraction sufficient to eliminate source contributions to groundwater PCLE zone**; and

2) Control (via TI) Endpoint – **Control soluble NAPL fraction sufficient to create stable (or shrinking) PCLE zone**.

However, the current NAPL response endpoint is to recover the soluble NAPL fraction from the impacted B-CZ/B-TZ GWBU off-site. Two major aspects, which are functions of the physical properties of creosote and its components, and the hydrogeologic complexity of the Site, greatly hinder recoverability of the soluble DNAPL fraction from the subsurface. These include the following:

1) Residual saturation in the GWBU matrix and confining clays: As discussed in Section 1.2, most monitoring wells where DNAPL was noted in the boring logs do not have measurable, or recoverable, DNAPL present in the wells. This indicates that in many areas within the Affected Property, including off-site, the creosote resides in the GWBUs as residual or stagnant NAPL trapped in the pore spaces of the geologic matrix and is no longer mobile under natural conditions, but continues to add dissolved contaminant mass to the GWBU as limited by the generally low solubilities of the creosote components; and

2) Creosote DNAPL in the low permeable clays: DNAPL noted in the boring logs for the B-CZ wells was typically observed within the B-CZ interbedded zone where the carbonate gravel seams were located. The hydraulic conductivities for these B-CZ wells screened across the carbonate seams had a geometric mean of 1.1x10-7 cm/sec (PBW, 2016). Therefore, the mobility of fluids (both NAPL and water) through the B-CZ is every limited.

As detailed in the ITRC Integrated DNAPL Site Strategy (IDSS) Guidance (ITRC, 2011), even partial source removal of the NAPL does not typically result in meeting groundwater restoration remedial goals. Case studies suggest that removing up to 80%–90% of the DNAPL source material will only lead to limited reductions of dissolved-phase contaminants downgradient of the NAPL (ITRC, 2011). Even in cases of complete NAPL removal, “contaminant diffusion into low-permeability zones can be a continuing source leading to dissolved-phase contaminant concentration reductions of only 1–3 orders of magnitude (OoMs)” (Chapman and Parker, 2005).

As a result, unless both the free-phase and residual DNAPL could be completely removed from the soil and GWBUs, groundwater response actions will not be able to attain the NAPL response objective of groundwater restoration within the PCLE Zones in a reasonable time frame.

Regardless, UPRR has developed a response action to more aggressively recover NAPL using conventional technology from the off-Site areas within the groundwater PCLE Zones, as detailed in the Revised RAP (August 2020).

Compliance with PMZ performance criteria at NAPL zone

The proposed groundwater response objective to address the Class 2 and Class 3 groundwater PCLE Zones for the A-TZ, B-CZ/B-TZ, and C-TZ GWBUs for the on-site and adjacent City of Houston ROW areas is through a Remedy Standard B PMZ, as detailed in the Revised RAP. With the PMZ established, the TCEQ TRRP Guidance provides only one NAPL response endpoint under this site condition: Recovery Endpoint – **Recover readily recoverable NAPL fraction**.

The response objectives will include compliance with PMZ performance criteria at the NAPL zone and control through institutional controls on groundwater use to protect exposure to residual NAPL in the GWBUs. As part of the evaluation for compliance with PMZ performance criteria, the on-going DNAPL recovery activities will be used to assess if the DNAPL in the GWBUs is considered readily recoverable and if other conventional or alternative NAPL recovery technologies should be considered. However, the NAPL Management TOOL A provided in the TCEQ NAPL Guidance (TCEQ, 2013) was used to evaluate qualitatively the recovery potential of the NAPL using conventional NAPL recovery technology, as detailed in Attachment A. Additional details on the proposed recovery activities are provided in the Revised RAP.

The following NAPL Responses Endpoint Matrix (Table 23) was prepared based on the information discussed under the site conditions, NAPL Triggers, NAPL Response Objectives, and NAPL Response Endpoints

UPRR Houston Wood Preserving Works – NAPL Response Endpoint Matrix (Table 23)

NAPL Trigger (*from* STEP 2)	Site Condition (*from* STEP 2)	NAPL Response Objective	NAPL Response Endpoint	
			Recovery Endpoint	Control Endpoint
❑ NAPL generating vapors Sec 2.1.1	❑ NAPL generating explosive vapor accumulations	Permanently eliminate NAPL as explosive vapor source (Sec 3.2.1)	RECOVERY ONLY ❑ Volatile fraction of NAPL recovered sufficiently to eliminate further explosive vapor accumulations (Sec 3.2.1.1)	CONTROL OPTION NOT AVAILABLE (Sec 3.2.1.2)
	❑ NAPL generating vapors that exceed inhalation PCLs at applicable inhalation POE	Abate inhalation exposure (Sec 3.2.2)	RECOVERY ❑ Volatile fraction of NAPL recovered sufficiently to eliminate vapors that exceed inhalation PCLs (Sec 3.2.2.1)	CONTROL ❑ Vapors controlled at NAPL source or at POE and exposure to vapors that exceed PCLs eliminated (Sec 3.2.2.2)
❑ **Migrating NAPL zone** **Sec 2.1.2**	❑ NAPL in vadose zone ≤ 15 ft below ground surface ❑ NAPL in saturated zone, not in PMZ* ❑ NAPL zone migration in the vadose zone or saturated zone	**Abate NAPL zone migration** **(Sec 3.3.1)**	**RECOVERY ONLY** ❑ NAPL recovered to residual saturation and/or to arrest migration	**CONTROL (via TI)** ❑ NAPL zone migration arrested with physical control **(Sec 3.3.1.2)**

LEL- *lower explosive limit P C L – protective concentration limit* **PMZ** *– plume management zone* **POE** *– point of exposure* **TI** *– technical impracticability demonstration*

*** The PMZ reference includes PMZs that have been approved by the TCEQ, PMZ eligible sites where a PMZ will be proposed to the TCEQ in a RAP, as well as a PMZ via TI demonstration.**
**** For the PMZ situation, the applicability of the readily recoverable circumstance must be determined, and recovery must occur if it is applicable (see Table 19 and Figure 6 and associated explanatory text).**
***** Potential ecological impacts from NAPL recovery actions may warrant deviation from this RECOVERY ONLY endpoint on a site-specific basis. Inquire with TCEQ.**

1.4 Develop NAPL Management Strategy

As detailed in the TRRP NAPL Guidance, Step 4 is to develop an overall NAPL management strategy based on the results of the NAPL Response Endpoint Matrix. The development of the strategy includes the following steps:

1. Compare the NAPL endpoints for each site condition;
2. Optimize the number of endpoints that addresses the relevant response endpoints; and
3. Select efficient NAPL recovery and/or control responses to achieve the response endpoints.

A summary inventory of the NAPL response actions and options is provided on Table 2 with the preliminary preferred options highlighted in green on the table. Since the NAPL site conditions include both on-site and off-site conditions, within a PMZ and outside a PMZ, there are various recovery and control endpoints targeted. Details of the planned response actions to address each of the recovery endpoints are provided in the Revised RAP.

Table 2 - Summary of Inventory of Response Actions and Options

NAPL Trigger	Condition	Objective	NAPL Response Objectives		Potential Response
			Recovery	Control*	See
Migrating NAPL Zone	On-Site only: NAPL discharge to ground surface	**Abate NAPL zone migration**	Sufficient to eliminate NAPL discharge	*Control by TI Only*	NAPL Collection Trench/Hot Spot Removal
Mobile NAPL Zone	Mobile NAPL threat to subsurface utility or structure	**Prevent mobile NAPL impact to shallow vadose zone receptors**	To residual saturation	*Control by TI Only*	Under development
	Mobile NAPL in vadose zone at depth ≤ 15 ft; in secured/restricted facility	**Prevent potential exposure to mobile NAPL**	To residual saturation	Exposure to NAPL zone prevented via institutional control	Physical barrier (i.e., concrete pavement) and IC (IM Yard)
	Mobile NAPL overlies groundwater NAPL zone in PMZ	**Prevent NAPL migration to groundwater**		NAPL zone migration control by physical or natural methods and institutional controls	
	Mobile NAPL in contact with groundwater	**Prevent disturbance of mobile NAPL that could induce migration**		Disturbance of mobile NAPL zone prevented via institutional control	
NAPL Contact with Groundwater	On-Site: NAPL contact w/ Class 2 / Class 3 groundwater, in PMZ	**Ensure compliance of NAPL zone in PMZ**	Recover readily recoverable NAPL*	*Control not available*	NAPL Recovery using MPE, pneumatic pumps
	Off-Site: NAPL contact w/ Class 2 / Class 3 groundwater, not in PMZ	**Groundwater restoration**	Recover soluble NAPL fraction sufficient to eliminate source contributions of NAPL to GW PCLE zone	*Control by TI Only*	NAPL Recovery using MPE
NAPL Aesthetic Impact or Nuisance Condition	Aesthetic or nuisance condition at ground surface, surface water, vadose zone or groundwater	**Eliminate NAPL aesthetic impact or nuisance condition**	Eliminate aesthetic or nuisance condition	Aesthetic impact or nuisance condition abated with physical control at NAPL zone and/or at POE	NAPL Collection Trench/Hot Spot Removal, Control through Physical Barrier (concrete pavement) and IC.

Note: Green highlight indicates the proposed response objectives for the Site

Union Pacific Railroad
4823 N 119th Street, Room 108
Milwaukee, Wisconsin 53225

EARTH VOLUMETRIC STUDIO 3-DIMENSIONAL MODEL, UNION PACIFIC RAILROAD HOUSTON WOOD PRESERVING WORKS SITE

INTRODUCTION

The former Union Pacific Railroad (UPRR) Houston Wood Preserving Works (HWPW) Facility at 4910 Liberty Road, Houston, Harris County, Texas (the Site) is located within industrial land and includes the Englewood Intermodal Yard, which is to the south of the former HWPW facilities. Details of the history and previous operations at the Site have been discussed in the previously submitted Affected Property Assessment Report (APAR) (ERM, 2000) and Revised APAR (ERM, 2004), as well as the RCRA Facility Assessment (RFA) Report (PRC, 1993).

Since 1995, Site investigations have included activities to evaluate surface and subsurface soils for the presence of dense non-aqueous phase liquid (DNAPL). Specifically, Cone-Penetrometer Testing/Rapid Optical Screening Testing (CPT/ROST™) investigations were conducted in 1995, 2001, 2008, and 2013 at the Site using laser-induced fluorescence (LIF) to identify the presence of DNAPL. As part of these investigations over 100 CPT/ROST™ borings and over 300 soil borings have been installed at the Site. Based on soil borings, measured DNAPL thicknesses in existing wells, and ROST™ readings, the occurrences of DNAPL in the on-site A-CZ (vadose zone), A-TZ, B-TZ/B-CZ, and C-TZ were described in the updated APAR addendum dated October 22, 2010 (PBW, 2010). DNAPL was recently re-assessed within the perimeter of the HWPW Site, the residential area north of the Site (City of Houston ROW), and in the Englewood Intermodal Yard using the Tar-Specific Green Optical Screening Tool (TarGOST®). In total, 54 TarGOST® borings were advanced as described in the Interim Non-Aqueous Phase Liquid (NAPL) and Total Petroleum Hydrocarbon (TPH)-NAPL Assessment Report (Golder, 2020). The recent and historical DNAPL assessments have indicated the presence of DNAPL in certain areas of the vadose zone, A-TZ and B-CZ/B-TZ within the HWPW Site and the Englewood Intermodal Yard, with evidence of DNAPL presence in certain areas to the north in the B-CZ/B-TZ and to the northeast in the C-TZ.

To provide an enhanced understanding of the occurrence and distribution of the bulk NAPL mass at the Site, Golder has compiled the ROST™ and TarGOST® results along with lithologic data from recent and historic investigations to develop a 3-dimensional visualization of the subsurface conditions at the Site. Specifically, the Earth Volumetric Studio (EVS) Version 2019.9.0 Software licensed from C-Tech Development was used to consolidate historical site investigation information, specifically related to NAPL

and Site hydrogeology spanning the past 25 years. Input to the EVS model included the results from the ROST™ investigations and the more recent TarGOST® borings conducted in 2019 and 2020 to identify the presence of NAPL. Most ROST™ and TarGOST® borings reached refusal at the top of the C-TZ or at shallower depths, therefore NAPL in the C-TZ is not presented in the EVS model. EVS uses kriging techniques to interpolate and extrapolate raw environmental data. For this evaluation, CPT/ROST™ and TarGOST® data were kriged separately due to their differing data collection methods and sensitivity to different compounds. ROST™ readily detects creosote and coal tar in the subsurface, however, the relative response sensitivity is less when compared to responses to petroleum hydrocarbons such as gasoline, diesel fuel, and jet fuel. TarGOST® was specifically developed to screen for heavier molecular weight NAPL phase polycyclic aromatic hydrocarbons (Golder, 2020). Raw results (data) from 97 CPT/ROST™ borings and 50 TarGOST® borings were input into the EVS model and evaluated independently. The two data sets complement each other by filling data gaps between the individual investigations and provide an enhanced visualization of the lateral and vertical extent of the NAPL zone. EVS kriging consists of a statistical analysis of the variability between pairs of points at various distances. Kriging is dependent on vertical and horizontal neighboring points and when distances between points become too great or there are low %RE readings between points the kriging in most instances is discontinued. In addition to the interpreted NAPL zone, lithologic information from 198 soil borings and CPT logs was imported into the EVS visualization to further support a comprehensive representation of the subsurface conditions. Consistent with the above kriging considerations and the bulk mass depiction objective of this visualization, the EVS depictions regarding NAPL presence at individual locations represent generalizations and other project documents providing the detailed Site data should be consulted when considering the possible presence of NAPL at a specific location.

SITE GEOLOGY

A geologic depiction of the Site was created in EVS using Module krig_3d_geology where the geologic information from 198 locations were kriged to provide a representative visualization of the lithology across the Site. The lithology was interpreted from 96 monitoring well boring logs, 80 CPT logs and 22 soil borings and summarized into six lithologic layers (A-Cohesive Zone (CZ), A-Transmissive Zone (TZ), B-CZ, B-TZ, C-CZ, and C-TZ). The underlying D-Cohesive layer is interpreted to represent the basal confining unit for the subsurface impacts at the Site but was not visualized in the model.

Along the northern HWPW property boundary, the A-CZ (which includes the vadose zone) is generally encountered from ground surface to a depth of approximately 15 feet below ground surface (bgs) and consists of clays, silty clays, and silts. The A-TZ is generally encountered between 15 and 25 feet bgs and consists of sands and silty sands with an average thickness of 7 feet. The A-TZ is underlain by the clays, silty clays, and silts of the B-CZ. The B-CZ is encountered between 22 and 44 feet bgs with an average thickness of 9 feet. From the western property boundary until the approximate midpoint of the Site, the B-TZ sands and silty sands are generally encountered from a depth of 30 feet to 40 feet bgs. The B-TZ is not encountered within the eastern portion of the Site; however, interbedded carbonate seams and calcareous nodules with clay and silty clay are present and constitute zones of secondary permeability. These B-CZ (IB) seams are encountered within the B-CZ/C-CZ and due to their variability and discontinuity throughout

Golder and the G logo are trademarks of Golder Associates Corporation.

the Site were not detailed in the lithologic visualization. The sand/silty sands of the C-TZ are generally encountered between 58 feet and 73 feet bgs, and are underlain by clays, silty clays, and silts.

CPT/ROST™

The CPT/ROST™ locations span the former Houston Wood Preserving Works Site, the Englewood Intermodal Yard as well as neighborhoods north and northwest of the Site. Data from 97 CPT/ROST™ borings were input into the model. The first 5 to 10 feet of ROST™ data collection is known to be susceptible to reduced certainty and to prevent inaccurate data all signals less than 20 percent reference emitter (%RE) were changed to 0%RE in the top 5 feet. In addition, if signals seen in the top 5 feet were significantly higher than the signals at 10 feet they were also made zero. This adjustment reduced the potential for overstating the plume geometry in the top 5 to 10 feet of the site. In addition, the signals between 5 and 10 feet bgs at points CPT-04R-01, CPT-02R-01, CPT-23R, and CPT-21R top were set to 0%RE as these signals were inconsistent with surrounding data and the signals below 10 feet bgs. The kriged dataset was then subset to a value representing only values above 25%RE, as values above 25%RE indicate the likely presence of NAPL.

Groundwater data from monitoring wells located along the northeast property boundary and northeast of the Site were added to the ROST™ data. Groundwater samples collected from monitoring wells (71B, 44A/C, 36A/B, and 33BR/A) in January 2020 all had detections of naphthalene below the laboratory reporting limits or multiple orders of magnitude below the Texas Risk Reduction Program (TRRP) residential assessment level (RAL) and were input into EVS as 0%RE at the top of the monitoring well screens. This input prevented EVS from overstating the plume in the A-CZ/TZ zones, which would occur due to the distance between CPT/ROST™ points. The NAPL zone produced from the ROST™ data and additional monitoring wells can be seen in Figure 1.

TarGOST®

TarGOST® borings were installed on Site between December 2019 and January 2020. TarGOST® locations were chosen to compliment the CPT/ROST™ locations, focusing on areas north of the HWPW Site, along and adjacent to the northern and western perimeter of the Site, and within the Englewood Intermodal Yard. The EVS model included data from 50 TarGOST® borings (in total 54 TarGOST® borings were performed, however some borings hit refusal and were reinstalled, and therefore were not included in the model).

The data from these 50 points were condensed using the data reduction tool in EVS to remove noise and decrease the file size. During the field investigation, health and safety protocols required hydrovacing of the upper 10 feet of each TarGOST® boring (utility clearance purposes) and backfilling with sand. Therefore, no pertinent TarGOST® information exists for the upper 10 feet of each TarGOST® location, and this portion of the EVS data was input into the model as ‘unknown.’ From this data, EVS presented a plume model using a subsetting level of 5%RE. Signals between 5% and 20%RE may indicate the presence of residual NAPL, but the lower %RE suggests that the NAPL is not likely to flow into a well installed at that location (Golder, 2020). These model conditions were used to allow for the most realistic extrapolation of

the data by EVS and representation of the NAPL zone. However, because the top ten feet was input as 'unknown', the EVS kriging algorithm can interpolate NAPL upward into the upper 10 feet of the model if the underlying TarGOST® values are sufficiently elevated. The A-CZ zone was turned off for the visualization of the plume due to the unknown values in the top ten feet causing EVS to make assumptions and conservatively krig the NAPL plume to the surface. However, based on field observations, NAPL is present in the vadose zone in areas within the footprint of the bulk NAPL mass on-site. The NAPL zone produced from the TarGOST® data can be seen in Figure 2.

EVS VISUALIZATION RESULTS

From 1995 to 2013, CPT/ROST™ investigations were conducted across the Site with a focus on the HWPW Site (Figure 1; Golder, 2020). In 2020, TarGOST® investigations were conducted along the northern and western perimeter of the Site, within the Englewood Intermodal Yard, and off-Site north of the Site (Figure 2; Golder, 2020). Together, the ROST™ and TarGOST® values represent the NAPL zone at the Site (Figure 3; Golder, 2020).

The NAPL zone produced from the TarGOST® and ROST™ investigations is primarily located on the eastern side of the former HWPW facility and the Englewood Intermodal Yard (Figure 3) and within the A-TZ and B-CZ/B-TZ (Figure 4). A very localized NAPL zone is also present along the western Site boundary in the B-TZ. In the EVS model, NAPL extends north of the HWPW site beneath Liberty Road within the B-TZ/B-CZ. Due to TarGOST responses in the A-TZ along the northern border of the Site, the kriging of the EVS model extends the responses in the A-TZ zone under Liberty Road; however, it is important to note that no elevated TarGOST responses were observed in the A-TZ in the off-Site borings.

The EVS model will be provided in a 4D visualization format which can be viewed using EVS Standalone 4DIM Player. The main NAPL zone can be viewed from all sides using the player.

FORMER HOUSTON WOOD PRESERVING WORKS – GROUNDWATER MODEL

INTRODUCTION

Golder Associates Inc (Golder) is completing a feasibility study (FS) to evaluate potential remediation options to address the creosote dense non-aqueous phase liquid (DNAPL) along the northern boundary of the former Houston Wood Preserving Works (HWPW) site in Harris County, Texas (the Site). The Site is located north of I-10 and east of I-69 on the northeast side of the city of Houston, as shown on Figure 1. As discussed in the revised Response Action Plan (RAP) to which this technical memorandum is attached, the remedial objective for the groundwater protective concentration level (PCL) exceedance zone (PCLE Zone) is to reduce the potential for migration of groundwater chemicals of concern (COC) concentrations above the critical PCLs from the Site and similarly reduce the potential for migration of mobile dense non-aqueous phase liquids (DNAPL) off Site. The FS is intended to review a wide range of potential remedial alternatives to address these remedial objectives and to provide a recommendation for the most appropriate remedial alternative based on technical reliability, economic feasibility, and the practicality of implementation for the remedial alternative. .

The first phase of the FS narrowed the remedial alternatives based on the criteria listed above and the results indicated two alternatives were best suited to achieve the goal of addressing DNAPL and dissolved-phase constituents of concern (COCs) in certain areas within and adjacent to the northern part of the Site. Those two alternatives are:

a) Installation of a soil/bentonite slurry cut off wall as a low-maintenance long-term hydraulic barrier along certain areas of the perimeter of the Site

b) Installation and operation of a groundwater extraction and treatment to provide hydraulic control of the groundwater (and DNAPL) along certain areas of the perimeter of the Site

As part of the second phase of the FS, Golder prepared a Site-specific numerical groundwater flow model of the HWPW Site to simulate steady state conditions calibrated to Site groundwater elevation data. Following calibration, the groundwater model was used to simulate changes to steady state conditions under remedial

alternatives A and B, described above, and to optimize the locations and design details for the two remediation alternatives to achieve the remediation objectives.

The numerical groundwater flow model was developed using the USGS numerical model MODFLOW 2005 (MODFLOW). The MODFLOW code uses a finite-difference approach to approximate the partial-differential flow equations and is based on flow through a three-dimensional array of cells. The graphic pre- and post-processor program, Groundwater Vistas Version 7 (Environmental Simulations Inc., GW Vistas), was used to facilitate model input and output. This report summarizes the development of the groundwater model and presents results for the most promising simulations for remedial alternatives A and B described above.

GROUNDWATER MODEL OBJECTIVES

The HWPW groundwater flow model was developed to simulate and examine the hydrogeological interactions along the northern Site boundary (Liberty Road area) and the Site boundary east of the Englewood Intramodal Yard. Specifically, simulations were developed to evaluate remedial alternatives A and B described above, and to optimize each concept in terms of providing hydraulic containment of DNAPL and impacted groundwater at the north and east Site boundaries. The results were then used to develop an engineering-level cost estimate for capital expenditures and operations and maintenance for a period of 15 years. The performance and costs for each alternative were then used to complete the second and final phase of the FS.

Specific to the two proposed alternatives, the modeling process was completed by setting up the steady-state model, estimating initial input parameters and allowing those to fluctuate within a range to achieve a model that was calibrated to observed groundwater elevations for the Site. Once calibrated to Site-specific conditions, the model was then used as a base model to create multiple scenarios to analyze how the modeled groundwater flow will react with a slurry cutoff wall in place and with or without groundwater extraction wells used to create hydraulic containment. Model runs with varying scenarios examined the potential for mounding, location and extraction rates for pumping wells, geometry, height and length of the needed barrier, as well as additional engineering controls that may be required to impede the flow of groundwater beyond the Site. The steps in creating each model are described herein.

FORMER HOUSTON WOOD PRESERVING WORKS EXISTING CONDITIONS MODEL SETUP

The model domain is defined by a focus area encompassing the Site, as shown in Figure 2, and a broader area of the regional aquifer where boundary conditions were set at the model edges. Figure 2 presents an aerial photograph of the region overlain by the model domain, for reference. To establish the model boundaries, a sub-regional groundwater model encompassing a larger extent beyond the primary focus area was established using general head boundaries for the six layers detailed below.

Following numerical model convention, the overall model domain was made sufficiently large to minimize the influence of boundary conditions on the area of interest. The area of interest, where groundwater impacts related to the Site occur, is generally centered in the model domain. Golder employed variable grid spacing when constructing the finite difference grid in the groundwater model. Cells within the primary focus area were assigned dimensions of 27 feet for rows and 37 feet for columns whereas, cells outside of the primary focus area, were expanded in size at a factor of 1.15 to maximum dimensions of 704 feet for rows and 1,100 feet for columns at the model extents. The total model domain covers an active area of approximately 24,000 acres. The resulting domain is shown in Figures 2 and 3.

The geology at the Site consists of interbedded clays, silts, and sands representative of fluvial-deltaic deposits of the Beaumont Formation. The Site-specific geology and hydrogeology were described in detail in the previous APAR (ERM, 2000), Revised APAR, (ERM, 2004), APAR Addendum (PBW, 2009) and Updated APAR Addendum (PBW, 2010). The Site stratigraphy from ground surface to a depth of about 135 feet below ground surface is grouped into nine distinct units with transmissive GWBUs separated by cohesive zones (with the GWBUs identified):

1) (1) Surface fill material (Fill);
2) (2) A-Cohesive Zone (A-CZ);
3) (3) A-Transmissive Zone (A-TZ) (GWBU);
4) (4) B-Cohesive Zone (B-CZ) (interbedded intervals);
5) (5) B-Transmissive Zone (B-TZ) (GWBU);
6) (6) C-Cohesive Zone (C-CZ);
7) (7) C-Transmissive Zone (C-TZ) (GWBU);
8) (8) D-Cohesive Zone (D-CZ); and
9) (9) D-Transmissive Zone (GWBU).

Cross sections showing the general relationship of the zones are provided in Attachment 1A of the Revised RAP. The lithology consists of a complex group of clays, silts, and sand layers. As an example, the B-CZ is comprised of clay, silty clay, and sandy clay. The B-TZ, which underlies the B-CZ, grades laterally from west to east into a portion of the B-CZ that contains interbedded, thin seams of silty sand, thin carbonate clayey gravel and nodule seams (~0.1 feet thick). This interval of interbedded carbonate nodules within the B-CZ clay is considered to be a distinct saturated unit based on its hydrologic properties and lithology. Very small amounts of water are observed

in the wells completed across this interbedded zone, and numerous soil borings drilled through this interval have noted DNAPL is the soil borings.

Therefore, the model stratigraphy was developed to match the six layers from A-CZ to C-TZ listed above, which were assigned to align with the Conceptual Site Model (CSM) layers as shown in Table 1. Prior to development of the groundwater model, the software program Environmental Visualization System (EVS, C-TECH) was used to develop a 3-dimensional (3-D) depiction of the geologic data from numerous drilling logs as well as 3-D visualization of NAPL and groundwater COCs for the HWPW Site. A technical memorandum detailing the EVS model is also provided in the Revised RAP (Appendix 3).

For the groundwater model, the initial layer assignments were obtained from the 3-D EVS output files, and these EVS files were imported into GW Vistas to define the bottom elevations for all layers. Bottom elevations were obtained from Site-specific soil boring logs and were extrapolated beyond the primary focus area. The total model thickness is generally 68.5 feet with some variation based on surface topography. The surface elevations of the groundwater model domain, outside of the EVS area, were sourced from the USGS National Elevation Dataset 2013 Digital Elevation Model. The general top and bottom elevations of each layer and the corresponding CSM layer are shown in Table 1.

Table 1: Groundwater Model Layer Information

Layer ID	Zone ID	Average Top (FT NGVD29)	Average Bottom (FT NGVD29)	Primary Lithology
1	A-CZ	45.5	31.5	Clay, silty clays, and silt
2	A-TZ	31.5	25.3	Sand and silty sands
3	B-CZ	25.3	15.6	Clays, silty clays, and silt
4	B-TZ/B-CZ	15.6	11.2	Sand and silty sands, pinching out to clays, silty clays, silt, interbedded carbonate seams, and calcareous nodules with clay and silty clay
5	C-CZ	11.2	-8.6	Clays, silty clays, silt, interbedded carbonate seams, and calcareous nodules with clay and silty clay
6	C-TZ	-8.6	-23.0	Sands and silty sands

Boundary Conditions

General head boundaries (GHB) were assigned around the perimeter of the model for all six layers, as shown in Figure 2. The GHB represents a constant water source beyond the limits of the primary focus area and provides characteristics of the regional aquifer system. A drain boundary was placed within the model to simulate the 60" storm drain that runs north to south along the eastern section of the primary focus area. The D-cohesive zone has no impacts and a low hydrologic conductivity allowing for an ideal no-flow bottom boundary for the groundwater model.

Figure 2: Boundary Conditions - Layers 1 - 6

MODEL INPUT PARAMETERS AND CALIBRATION

MODFLOW utilizes several parameters to represent the hydraulics within the model. Each parameter is zoned within the grid to represent the different materials that compose each layer of the model. Initial values were input from various data sources to provide a preliminary solution for the steady-state simulation. Golder performed calibration procedures in the steady-state simulation to produce model results closely matching water level elevations from the May 14, 2018 and January 4, 2019 data sets. The parameters below represent the hydraulic characteristics of the aquifer:

- lateral hydraulic conductivities (K_h);
- vertical hydraulic conductivity (K_v);
- recharge.

Each parameter is discussed briefly in the subsequent sections. Data sources are provided for each of the initial values. Following a discussion of the calibration process, the final calibrated values and statistics are presented.

Hydraulic Conductivity

Initial values for hydraulic conductivity were derived from historic hydrologic data conducted onsite for the A-TZ, B-CZ, B-TZ, and D-TZ layers by Golder and others. For the C-TZ layer, slug test data were utilized from Idaho National Laboratory's subsurface contaminant transport investigations at the North Cavalcade Superfund Site,

which has a similar lithology, approximately two miles northwest of the HWPW Site. Hydraulic conductivity was expressed in units of feet per day (ft/d) and identified in the model as zones. Each layer was assigned a zone based on the porous material associated with that layer.

Layer 1 represents the ground surface to subsurface zones (A-CZ) which are comprised of clay, silty clays, and silts. Layer 2 is the first transmissive zone, identified as the A-TZ, and is comprised of sand and silty sands. Layer 3 (B-CZ) is primarily made up of cohesive soils that contain clays, silty clays, and silts. Layer 4 represents the discontinuous B-TZ sand and silty sands in the western half of the Site that pinches out to B-CZ cohesive soils in the east. Layer 5 underlies the B-TZ in the west and B-CZ in the east. This layer simulates the C-cohesive zone identified as the C-CZ which is comprised of cohesive soils such as clays, silty clays, and silts with interbedded carbonate seams. Layer 6 is a sand and silty sand layer identified as the C--TZ. The initial conductivity values for each layer are discussed further in the calibration subsection.

Recharge and Evapotranspiration

The recharge package of MODFLOW was used to simulate infiltration of rainfall into the porous materials in units of ft/d. Three zones were delineated for the HWPW model domain. Each zone was specific to certain Site characteristics at the model surface. Zone 1 was assigned to the previously developed HWPW Site that has been cleared of structures as well as the residential areas around the HWPW Site. Zone 2 was assigned to the intermodal facility which is primarily capped with impervious materials. Zone 3 was assigned to the areas along the rail line that run southwest to northeast and split the HWPW Site and the intermodal facility. Previous recharge studies for this region indicate relatively low recharge values in the range of to 0.0004 to 2 inches per year (up to 0.0004 ft/yr) (Scanlon, 2003[3]). Therefore, initial recharge values were set to be generally low, and the range for acceptable recharge varied from a minimum value of 9.13×10^{-8} ft/d to a maximum value of 0.00046 ft/d. The recharge zones are shown on Figure 3.

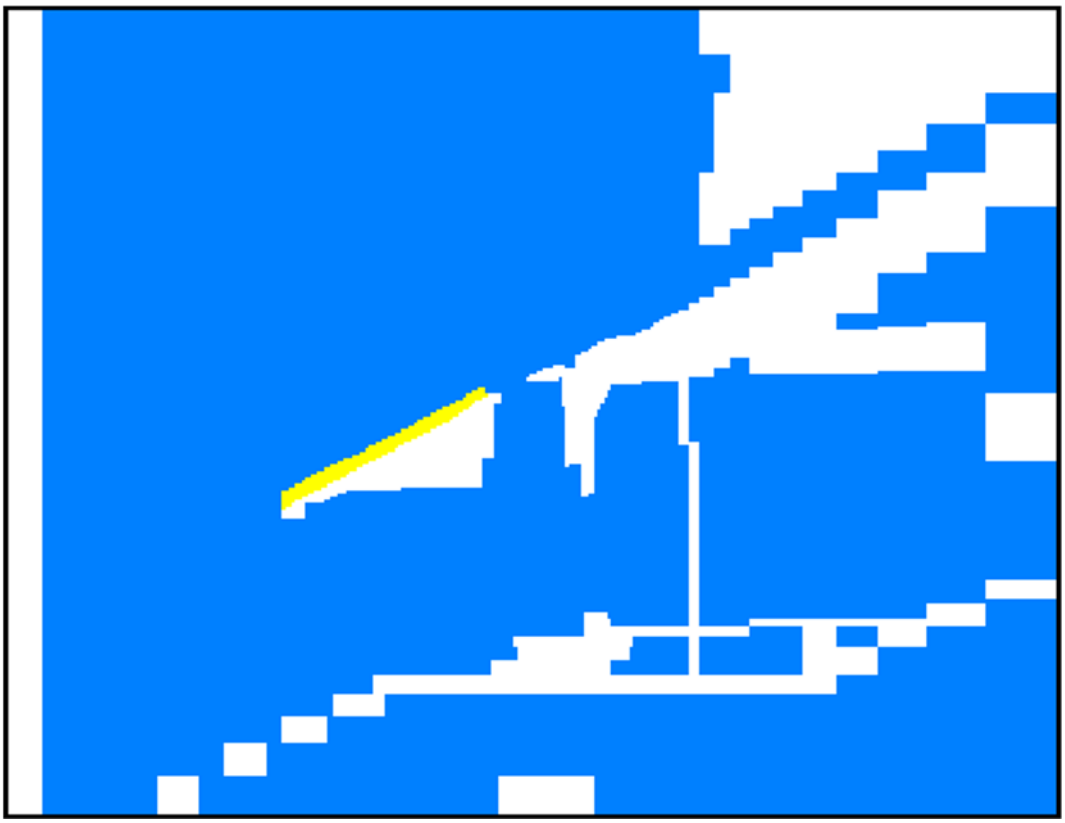

Figure 3: Recharge Zones

Calibration

MODFLOW was run in steady-state mode, with the initial heads in the model set as the top of Layer 1. Groundwater elevation data for the existing network of monitoring wells provided reference groundwater elevations at varying intervals that Golder used as calibration targets for the steady-state model calibration. These targets were placed into the layer of each model that matched the screened interval of the monitoring wells. There are many sets of observed water levels (calculated groundwater elevations) for the Site which have been measured during semi-annual monitoring events. To select an appropriate groundwater elevation data set for calibration, the historic monthly rainfall for the past 20 years was evaluated and periods of time where rainfall was relatively stable (not anomalously high or low for 1-2 months before the data set was collected). That evaluation was cross referenced with the historic groundwater elevation data sets and the relative number of operational monitoring wells for each data set to select representative sets of data where groundwater elevation were expected to be relatively stable and most of the current monitoring wells were in place and monitored.

Based on this evaluation, groundwater elevation data sets for two monitoring events were selected for use in model calibration, including May 14, 2018 and January 3, 2019. The primary calibration process was conducted using the groundwater levels from the May 14, 2018 event. Once the difference between the calibration water level elevations and the observed elevations was sufficiently low (root mean square (RMS) difference of < 1 ft and scaled RMS difference < 5%, which represent commonly accepted calibration targets), the January 3, 2019 data set was used to crosscheck the calibration of the model and test the stability of the calibration results. The

measured and calculated head values for each target are summarized in Table 2. The target locations in Layers 2, 3, 4, and 6 are depicted in Figures 4, 5, 6, and 7, respectively.

The calibration process was supported by an automated parameter estimation tool (PEST) that is embedded in GW Vistas Version 7. To properly use the PEST tool, the modeler identified the parameters that can vary during calibration and ranges for those parameters (ranges based on known / observed and literature values). For the HWPW groundwater model, PEST was used to vary hydraulic conductivity values (based on a reasonable range from aquifer hydraulic tests at the Site) and recharge values (based on values presented in Scanlon, 2003). The PEST algorithm then varies the values of each parameter for each zone within the prescribed range to achieve the smallest overall difference. Using this approach, hydraulic conductivity and recharge were calibrated iteratively. During hydraulic conductivity calibration, the anisotropy values for each material were set based on ranges published in literature[4] and professional judgment.

The standard PEST approach consists of iteratively adjusting parameters zone by zone. A user can vary the values across a layer by using multiple zones; however, this can be a time-consuming process without detailed soil characterization across the relatively large model domain. Another mechanism built into GW Vistas is “Pilot Points”, which represent an alternative way of using PEST to vary parameter values on a cell-by-cell basis across the entire model instead of zone-by-zone. To achieve this, pilot points are discretely placed in the model to be located between known groundwater elevations and the parameter to be calibrated is identified along with the initial value and range of the parameter. For the HWPW steady state model, multiple pilot points were placed in each layer within areas where observed groundwater elevations exist. PEST was then used to vary the hydraulic conductivity values at each pilot point within the prescribed boundaries. Once complete, Groundwater Vistas kriges the calibrated values at each pilot point across the layer to avoid sharp changes in values from cell to cell. The final calibrated hydraulic conductivity values for each layer are shown in Figures 8-13.

The calibrated input parameters are included in Tables 6 and 7, and calibration statistics are presented in Table 8. An observed versus modeled water levels plot is provided in Figure 14 and the resulting steady-state potentiometric maps are presented in Figures 15-17 (layers 2, 4 and 6 respectively).

PROPOSED REMEDIAL ALTERNATIVES

Golder used the calibrated groundwater model to simulate and evaluate the performance of proposed remedial alternatives. The goal of each alternative was to reduce the potential for off-Site migration of DNAPL and impacted groundwater from the northern HWPW property boundary. The groundwater modeling task of the remediation design focused on variations of the following alternatives:

- Partial Slurry Cut-off Wall – Varying Alignment and Length
- Groundwater Extraction and Treatment – Hydraulic Containment on North Boundary
- Limited Length Partial Slurry Cut-off Wall with Groundwater Extraction (edges)
- Limited Length Partial Slurry Cut-off Wall with Permeable Reactive Barrier (edges)

Each of the alternatives were modeled separately and results were checked for their influence on groundwater mounding or drawdown and changes in groundwater flow direction in each of the transmissive zones.

Partial Slurry Cut-off Wall – Varying Alignment and Length

The cut-off wall concept was selected for further evaluation due to a variety of attributes including:

- Site soils are well suited for soil/bentonite slurry
- Ability to isolate most of the observed impacts inside the Site boundaries – positive migration control
- Proposed depths and alignment amenable to moderate costs
- Commonly used and widely accepted technology

Different slurry wall layouts and depths were simulated to provide a high-level of assessment of two proposed layouts. The first proposed layout was a layout of approximately 1,500 linear feet (LF) primarily along the northern Site boundary with a small extension along the railroad tracks. The bottom of this proposed slurry wall orientation was keyed into the D-CZ (model bottom). In terms of the groundwater model, this version of the wall penetrates all layers along the entire alignment. Hydraulic conductivity for all slurry wall scenarios was defined as 2.83×10^{-5} ft/d (1.0×10^{-8} cm/s) and the wall thickness was modeled as 2.5 ft. Velocity vectors and head residuals at the calibration targets were used to evaluate changes in flow paths and potential mounding due to the slurry wall. The layout, velocity vectors, and head residuals for each layer are shown in Figures 18 through 20.

The second simulated slurry wall layout was an extended alignment in both directions to: 1) extend the western side of the wall to reduce the potential for impacted water bypassing the western end of the shorter alignment; and 2) to extend the eastern side of the cut off wall further south to address the potential for migration of impacted groundwater (and potential DNAPL) along the eastern side of the intermodal yard. The total wall depth for this layout remained consistent along the western extension (wall extended to the base of the C-TZ / bottom of the model); however, the eastern side of the cut off wall (north-south oriented wall alignment) was simulated to a depth of roughly 50 feet (keyed into the C-CZ layer, above the C-TZ layer). The extended wall layout, velocity vectors, and head residuals for each layer are shown in Figures 21 through 23.

Discussion Relevant to Feasibility Study

The groundwater model simulations for the initial version of the slurry wall (approximately 1,500 LF) are shown in Figures 15 through 17. Based on the simulation results, limited mounding of groundwater is anticipated on the

southern side of the wall. While the cut-off wall addresses advective flow across the northern Site boundary where the wall is placed, the mounding affects create a small area of reverse flow at the edges of the cut-off wall (flow around the edges). This is an expected condition when placing a partial barrier wall. Although the simulated shorter wall would reduce the potential for DNAPL migration across the northern boundary, it is possible that dissolved-phase COCs could migrate around the edges of the wall, generally following the velocity vectors shown in Figure 15. On the western edge of the wall, this potential for groundwater flow around the wall could result in migration of dissolved phase COCs toward Liberty Road to the north. Studies have shown that the dissolved COC plumes from creosote sources tend to have concentrations three to 50 times lower about 150 feet downgradient of the source compared to source concentrations[5],), however Liberty Road is located within 100 feet of the western end of the wall. In addition, the shorter cut-off wall concept does not address the potential for off-Site migration of DNAPL or dissolved phase COCs along the eastern boundary of the intermodal yard.

The second simulation incorporates a longer cut-off wall alignment (greater than 3,000 LF) by adding a southern leg to the eastern side, which reduces the potential for migration across the eastern Site boundary, and an extension of the western end of the short cut-off wall generally oriented in a southwest direction, as shown in Figures 18 through 20. The extension on the western side is intended to address groundwater flow around that edge of the cut-off wall. While groundwater does flow around the updated wall edge, that edge of the wall is more than 600 feet from the nearest property boundary. Along the eastern side of the Intermodal Yard, the simulated cut off wall is approximately 50 feet deep, extending through cell 5 (through all layers except the C-TZ zone). Similar to the western extension, groundwater continues to flow around the southern edge of the eastern wall alignment. However, the southern end of the wall is greater than 300 feet from the nearest known occurrence of DNAPL which addresses the potential off-Site migration of DNAPL and dissolved phase COCs toward the east.

In summary, both conceptual slurry cut-off wall alignments reduce the potential for DNAPL migration across the northern property boundary. The shorter wall alignment does not eliminate the potential for dissolved phase COCs to migrate off Site, and would need to be supplemented with additional remedial measures at the wall edges (e.g., permeable reactive barrier or groundwater extraction and treatment) to mitigate the potential for dissolved phase COCs to migrate off Site. In addition, the shorter wall alignment does not reduce the potential for offsite migration along the eastern side of the Intermodal Yard.

The longer cut-off wall alignment provides enhanced control of DNAPL and dissolved phase COCs, and also reduces the potential for offsite migration along the northern and eastern property boundaries without the need for additional remediation measures at the wall edges.

Groundwater Extraction and Treatment (Recovery Wells)

Groundwater extraction and treatment was also selected for further evaluation as a remediation alternative due to the following:

- Suitable infrastructure;
- Commonly used approach for targeted capture and hydraulic containment; and
- Easy to implement

Golder simulated two scenarios that utilize groundwater extraction to reduce the potential for off-Site migration of impacts at the HWPW Site. The first scenario included nested extraction wells along the northern Site boundary only. Each nest included groundwater extraction wells screened in each of the transmissive zones. Five recovery wells nests were used in this scenario. Pumping rates for each extraction well were determined iteratively with the goal of hydraulic containment along the northern property boundary. The pump layouts, pumping rates, groundwater velocity vectors, and groundwater potentiometric maps are presented in Figures 24 through 26.

The second groundwater extraction and treatment scenario included nested extraction wells along the east side of the Intermodal Yard (the eastern property boundary) in addition to the wells along the northern boundary, presented above. Pumping rates were determined iteratively with the goal of hydraulic containment along the northern and eastern boundaries. The resulting groundwater model simulation results are presented in Figures 27 through 29.

Discussion Relevant to Feasibility Study

The objective of this series of simulations was to project the number of well clusters and associated extraction rates for hydraulic containment along the northern and eastern property boundaries. Based on the simulation results, it is projected that hydraulic containment could be achieved using eight extraction well clusters with two to three nested extraction wells in each cluster. At each cluster, the total extraction rate is less than 1 gallon per minute, and the total system extraction rate is estimated to be less than eight (8) gpm.

To maintain the projected hydraulic containment, all extraction wells would need to be operational continuously for the duration that hydraulic containment is needed. The extracted water would be transferred to a treatment system on the HWPW Site for treatment and ultimate discharge.

Use of groundwater extraction and treatment is commonly used for hydraulic containment and is projected to reduce the potential for off-Site migration of groundwater impacted with COCs, in particular from the high permeability zones (the TZ zones). Given that the primary purpose of a groundwater extraction and treatment system is hydraulic control and not DNAPL recovery, the ability of this system to address DNAPL would be limited. It is possible that the creation of hydraulic cones of depression could enhance the potential for downward DNAPL movement in those areas.

Partial Slurry Cut-off Wall with Groundwater Extraction

As discussed in the previous section related to the slurry cut-off wall alignments, the shorter alignment may have limited effectiveness in addressing dissolved phase COCs at the wall edges. Consequently, additional model simulations were run to evaluate the influence of operating groundwater extraction wells at the edges of the shorter wall alignment.

Specifically, Golder modeled a third remedial option that combined the shorter version of the slurry cut-off wall with groundwater extraction wells for hydraulic containment around the wall edges. Groundwater extraction well nests were placed near the northwest and southeast wall edges. Similar to the hydraulic containment scenarios described previously, nested groundwater extraction wells were simulated with one well in each transmissive zone and one well nest at each end of the cut-off wall. Pumping rates were determined iteratively to estimate the minimum extraction rates to capture groundwater flowing around the wall edges. Figures 30 through 33 present the simulation results for the slurry wall and groundwater extraction remediation option.

These simulations indicate that operating well clusters at each end of the wall with a combined extraction rate of approximately 1 gallon per minute per well cluster would be projected to provide containment at the edges of the shorter wall. To be effective, these extraction wells would need to operate continuously for the duration of time that containment is needed at the cut off wall edges.

Permeable Reactive Barrier (PRB)

To provide a less operationally intensive alternative to continuous operation of extraction wells at the edges of the shorter cut off wall alignment, a fourth remedial option was simulated to include a combination of the shorter partial slurry cut-off wall and sections of permeable reactive barrier walls at each end of the cut-off wall to address groundwater flowing around the wall edges. The shorter version of the wall alignment was used for the slurry wall with PRB extensions along the west and southeast ends of the slurry wall. The goal of modeling this scenario was to evaluate the hydraulics of adding a PRB onto the end of the slurry wall and estimate the length of PRB to target groundwater at the edges of the slurry wall. Parameters associated with the slurry wall remain the same to those in the slurry wall only scenarios. The PRB was modeled with a 10-ft thickness and a hydraulic conductivity equal to 0.283 ft/d (1.0×10^{-4} cm/s). The results for these simulations are presented in Figure 34 through 36, and the PRB lengths are noted on the figures.

These simulations indicate that a higher permeability reactive barrier installed at each end of the shorter wall would be projected to address dissolved phase COCs around the barrier wall edges. To design an effective barrier amendment and the required treatment time (correlated to PRB thickness), a treatability study would be needed. The concept of a shorter barrier wall with PRB elements at each edge is feasible to address offsite impacts to the north of the Site. However, none of the scenarios associated with the shorter cut-off wall would be expected to affect groundwater to the east of the Intermodal Yard.

SUMMARY

As part of the HWPW Feasibility Study, Golder used numerical groundwater modeling to create a calibrated steady state groundwater flow model of the existing conditions at the Site, and to simulate and evaluate potential remediation alternatives for addressing DNAPL and dissolved-phase COCs along the northern property boundary (parallel to Liberty Road) and along the eastern side of the Intermodal Yard. Specifically, the groundwater model was used to further evaluate two distinct remedial alternatives, including: 1) a soil/bentonite slurry wall (physical hydraulic barrier); and 2) creation of a hydraulic containment barrier using groundwater extraction and treatment technologies. The groundwater model simulations demonstrate that either method of containment can reduce the potential for migration of dissolved phase COCs; however, the physical barrier wall method would be anticipated to have greater impact on potential migration of DNAPL than would be expected for the groundwater extraction and treatment alternatives.

The simulations further demonstrate that two barrier wall concepts are feasible. The first (shorter) wall alignment addresses migration of DNAPL and dissolved phase COCs along the northern Site boundary, but not the eastern Site boundary. In addition, some form of additional remediation would likely be needed at the outer ends of the shorter wall alignment to manage dissolved phase COCs that could potentially flow around the ends of the wall. The second barrier wall concept includes a longer alignment to the west and a segment along the eastern property boundary. In that concept, potential DNAPL migration from the Site is projected to be contained on both the north and eastern sides. In addition, the projected groundwater flow path from the known DNAPL area to the nearest off-Site location (around the ends of the wall) is significantly longer than the estimated maximum plume length of dissolved COCs from the nearest DNAPL source material. As a result, and as has been shown for the other portions of the Site, groundwater COC concentrations would likely attenuate before reaching the off-Site locations.

The results of this model are intended to be used to support the evaluation of remedial alternatives in the Feasibility Study portion of the Response Action Plan (RAP) for the Site.

MASS FLUX EVALUATION, UNION PACIFIC RAILROAD HOUSTON WOOD PRESERVING WORKS SITE, HOUSTON, HARRIS COUNTY, TEXAS

The former Union Pacific Railroad (UPRR) Houston Wood Preserving Works (HWPW) Facility at 4910 Liberty Road, Houston, Harris County, Texas (the Site) is located within industrial land and includes the Englewood Intermodal Yard, which is to the south of the former HWPW facilities. The Site was first developed for wood preserving operations in 1899 and operated wood preserving operations until 1984 when operations ceased. Historic operations at the Site resulted in releases of petroleum-related products, primarily creosote, to the subsurface. Details of the history and previous operations at the Site have been discussed in detail in the previously submitted Affected Property Assessment Report (APAR) (ERM, 2000) and Revised APAR (ERM, 2004), as well as the RCRA Facility Assessment (RFA) Report (PRC, 1993).

As detailed in the APARs and subsequent reports, the Affected Property geology and hydrogeology have been extensively investigated through the installation of over 130 monitoring wells and over 400 soil borings at the Site. Based on the investigations, the site stratigraphy from the ground surface to a depth of approximately 135 feet is separated into the following units: Fill Material (0 to 5 feet thick), A-Cohesive Zone (A-CZ) (8 to 15 feet thick); A-Transmissive Zone (A-TZ) (4 to 21 feet thick); B-Cohesive Zone (B-CZ) (6 to 19 feet thick); B-Transmissive Zone (B-TZ) (discontinuous, where present, 3 to 10 feet thick); C-Cohesive Zone (C-CZ) (8 to 20 feet thick); C-Transmissive Zone (C-TZ) (10 to 13 feet thick); D-Cohesive Zone (D-CZ) (17 to 36 feet thick); and D-Transmissive Zone (D-TZ). Monitoring wells have been completed in these transmissive zones and have been sampled and monitored for many years.

The most recent groundwater monitoring data from the Site was presented in the Interim Groundwater Monitoring Report (2019-2020) dated April 30, 2020. The January-March 2020 site-wide groundwater sampling included the sampling of the additional monitoring wells that were installed in February through March 2020 to further assess groundwater at the Site. Based on that data, as well as historical groundwater data collected from the Site, Golder evaluated the mass flux of chemicals of concern in the shallow transmissive zones or groundwater bearing units (GWBUs). A mass flux evaluation was conducted to enhance the understanding of the Site as follows:

Golder and the G logo are trademarks of Golder Associates Corporation.

- Mass flux estimates along transects near source areas can yield information about the source zone strength, source zone hydrogeological characteristics, and the degree of heterogeneity in the GWBU;
- Spatial and temporal mass flux comparisons can project the attenuation capacity of the GWBU, delineate areas of the highest contaminant mass and mass flux zones within a plume, and identify the optimal treatment zones within a groundwater plume;
- Mass flux estimates can be used to support remedial goals and performance metrics, select and design remediation systems, monitor remedy performance, and define transition points between technologies.

The mass flux evaluation was conducted to better understand conditions along the northern property boundary of the Site where groundwater discharge from the Site is occurring based on groundwater flow conditions.

OVERVIEW

Mass flux is defined in the Interstate Technology Regulatory Council (ITRC) document *"Use and Measurement of Mass Flux and Mass Discharge"* (ITRC, 2010) as the mass of a chemical that passes through a defined cross-sectional area over a period of time and is expressed as mass/time/area (i.e., g/d/m^2 or mg/d/m^2). Mass flux combines two features of a chemical of concern (COC) plume: how much of the COC is in the groundwater (i.e., the concentration) and how fast the water is moving through a defined cross-sectional area (i.e., the flow rate). These two features together quantify source or plume strength at a given time and location. Mass flux (J) is calculated as follows (ITRC, 2010):

$$J = -K * i * C$$

J = mass flux, M/t/L^2 (i.e., g/d/m^2)
K = saturated hydraulic conductivity, L/t (i.e., m/day)
i = hydraulic gradient, dimensionless (i.e., m/m)
C = COC concentration, M/L^3 (i.e., mg/L)

METHODOLOGY

A transect of wells at or near the northern property boundary from each applicable lithologic zone was selected for the evaluation (see Figure 1 showing the A-TZ wells and Figure 2 showing the B-CZ/BT-Z wells).

These wells are identified in the following table:

Golder Associates Inc.
5170 Peachtree Road, Building 100, Suite 300, Atlanta, Georgia, USA 30341 T: +1 770 496-1893 F: +1 770 934-9476

Table 1 – Summary of monitoring wells with hydraulic conductivities and hydraulic gradients along the transect at or near the northern property boundary

The representative hydraulic conductivity values for the A-TZ and B-TZ/B-CZ are based on the results of hydrologic testing conducted by ERM (1997, 2004) and PBW (2014). The values used were confirmed to fall within the range of hydraulic conductivity values for the calibrated groundwater flow model (see Groundwater Model Technical Memorandum in Appendix 3 of RAP).

golder.com

Creosote is hydrophobic, highly insoluble, and consists of a complex mixture of compounds, including PAHs and trace levels of BTEX. Only a few of the components of the creosote are soluble (i.e. aqueous concentration in equilibrium with creosote) including dibenzofuran (1.6 mg/L), naphthalene (12.4 mg/L), and phenol (1,388 mg/L) (King, et al, 1994). This overall low solubility for creosote results in limited groundwater COC concentration plumes that do not extend great distances from the source material (i.e. NAPL). Given the chemical characteristics of creosote, Golder selected the more soluble constituent of naphthalene as the COC to conduct the mass flux evaluation. Naphthalene was selected as the representative constituent based on its occurrence across many areas of the Site and some areas off-Site, its concentrations relative to other detected constituents, its chemical properties, and its lower rate of decay relative to some other detected constituents (i.e., benzene). Laboratory analytical data for naphthalene collected since 2010 (where available) was used for evaluation of mass flux. When naphthalene was not detected above the laboratory method reporting limit, half the value of the reporting limit was used for mass flux calculation.

The naphthalene data and corresponding mass flux calculations can be found in Appendix A. Graphs of mass flux for the northern transect wells in the A-TZ, and B-TZ/B-CZ are included as Figure 3 and 4, respectively.

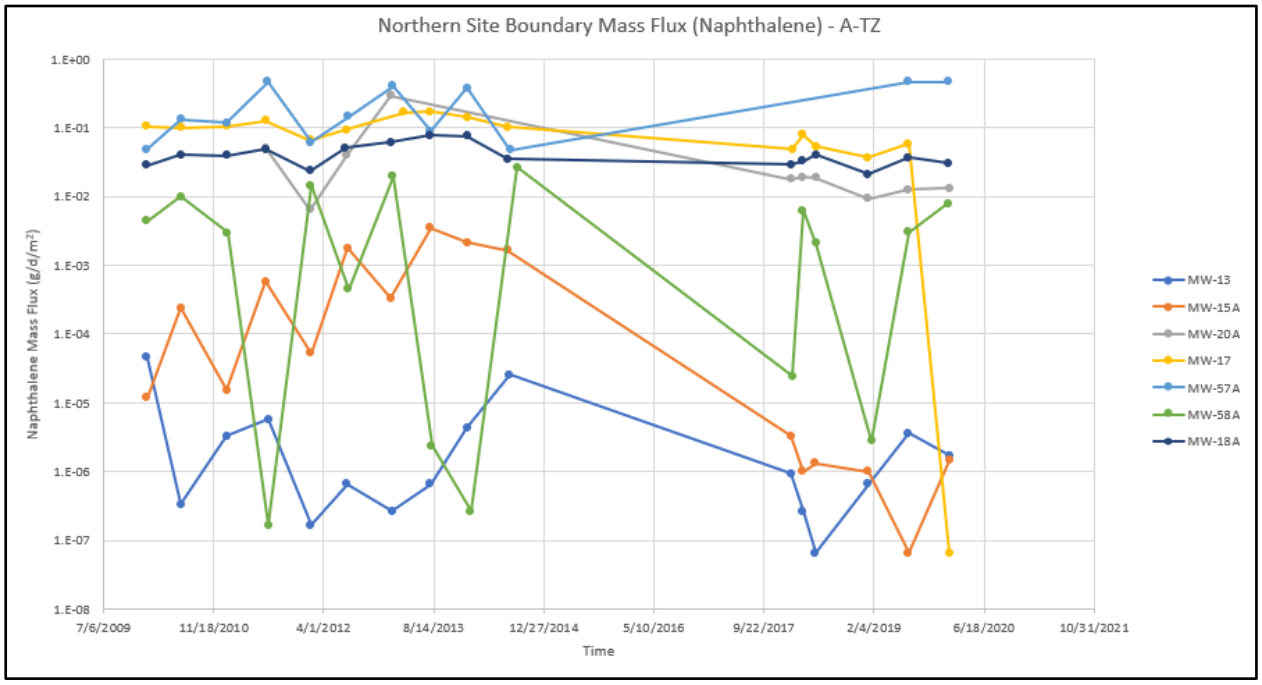

Figure 3: Naphthalene mass flux versus time for the northern site boundary wells in the A-TZ hydrogeologic unit.

RESULTS

The A-TZ transect wells exhibited some of the highest mass flux values for naphthalene along the northern property boundary. Since approximately 2010, A-TZ monitoring wells MW-17, MW-18A, MW-20A, and MW-57A have generally exhibited mass flux values between 0.01 and 1 g/d/m^2. (Note: MW-20A is more interior than other A-TZ transect wells, but the well was analyzed because it is located between MW-15A and MW-17. In addition, the January 2020 calculated mass flux, which was nearly six orders of magnitude less than the preceding ten years of historical values for MW-17 is considered an anomaly. Mass flux in wells MW-13 and MW-15A has been decreasing in recent years and was calculated at 1.72×10^{-6} and 1.45×10^{-6} g/d/m^2, respectively. Mass flux in MW-58A has been highly variable over the past ten years.

Monitoring wells MW-14 and MW-15B are screened the more transmissive B-TZ along the northern property boundary. Mass flux in MW-14 and MW-15B have declined over time; however, recently, there has been some variability in MW-15B, with mass flux ranging from 3.42×10^{-4} g/d/m^2 to 1.04×10^{-8} g/d/m^2. B-CZ wells MW-57B and MW-72B have also had slight reductions in mass flux over time and both wells currently exhibit mass flux of approximately 1×10^{-5} g/d/m^2. The highest mass flux values calculated for the B-TZ/B-CZ transect are generally several orders of magnitude lower than the highest mass flux values calculated for the A-TZ transect.

CONCLUSION

The lithology at the HWPW site is complex and heterogeneous. This evaluation indicates that the highest regions of mass flux for naphthalene in groundwater along the northern property boundary of the Site should occur in the A-TZ, east of the Liberty Road intersection with Lavender Street to the eastern Site property boundary. Naphthalene concentrations are elevated (higher than PCLs) in the B-CZ wells evaluated for this assessment; however, the calculated horizontal mass flux values were low relative to wells in the A-TZ with similar concentrations.

Based on the mass flux calculations for the transect along the northern boundary presented herein, the mass flux calculated for the A-TZ was several orders of magnitude higher than mass flux calculated for the B-TZ/B-CZ PCLE zones. However, the groundwater PCL exceedance (PCLE) Zone maps presented in the IGMR (Golder, 2020a) indicate that the A-TZ groundwater PCLE Zone only extends into the City of Houston Liberty Road right-of-way (ROW), whereas the B-CZ/B-TZ groundwater PCLE Zone extends further north onto the off-site properties. This is primarily due to the groundwater flow conditions where the A-TZ has a northeasterly flow direction on the west side of the transect and becomes more easterly on the east side of the transect. As a result, the mass flux calculations are representative for each of the wells along the transect, but the mass flux does not travel perpendicular to the transect but is closer to parallel with the transect. As discussed in the Updated APAR Addendum (PBW, 2010), the 60-in wastewater line runs north to south just east of the transect and appears to intersect the A-TZ. As a result, the general groundwater flow direction in the A-TZ is influenced by this feature resulting in the easterly flow on the east side of the Site.

For the B-CZ/B-TZ, the bulk of the naphthalene mass appears to be in the B-CZ portion based on the groundwater analytical data. Despite differences in hydraulic conductivity (higher in the B-TZ wells) and concentrations (higher in the B-CZ wells), the calculations overall indicated low mass flux across the transect. Based on the results of groundwater monitoring, DNAPL and/or elevated COCs indicating potential NAPL are present within off-site wells MW-35B (B-TZ), MW-68B (B-TZ; DNAPL), MW-32B (B-CZ; DNAPL), and MW-70B (B-CZ/ DNAPL). These wells, located beyond the transect, indicated that the DNAPL mass predominately found in the secondary porosity (i.e., thin carbonate seams and fractures in the clay) off-site in the B-CZ/B-TZ is providing a source for the dissolved phase in the B-CZ/B-TZ groundwater off-site rather than a significant mass flux from the Site.

1) "<" - Indicates naphthalene was not detected above the laboratory reporting limit and half of the reporting limit was used in the mass flux calculation.

Appendix 3I

DNAPL Recovery Activities Quarterly Report dated August 28, 2020

August 28, 2020 Project No. 19119232

Ms. Maureen Hatfield
MC-127
VCP-CA Section, Remediation Division
Texas Commission on Environmental Quality
P.O. Box 13087
Austin, TX 78711-3087

RE: DNAPL RECOVERY ACTIVITIES QUARTERLY REPORT – 2ND QUARTER 2020
UNION PACIFIC RAILROAD HOUSTON WOOD PRESERVING WORKS FACILITY
4910 LIBERTY ROAD FACILITY, HOUSTON, TEXAS
POST-CLOSURE CARE PERMIT NO. HW-50343; INDUSTRIAL SWR NO. 31547

Dear Ms. Hatfield:

Golder Associates Inc. (Golder), on behalf of Union Pacific Railroad Company (UPRR), submits this 2nd Quarter 2020 summary report for the dense non-aqueous phase liquid (DNAPL) recovery activities conducted at the UPRR Houston Wood Preserving Works Facility (the Site). As detailed in the Response Action Plan (RAP) dated November 24, 2014, a 24-month DNAPL recovery pilot test, consisting of manual DNAPL recovery from selected wells on a monthly basis, was conducted at the Site. Following the 24-month pilot testing period, the DNAPL recovery activities have continued monthly following the same procedures detailed in the RAP. In response to the Texas Commission on Environmental Quality (TCEQ) Technical Notice of Deficiency dated April 11th, 2019, the DNAPL recovery frequency was increased to bi-monthly (twice a month) in June 2019. The following monitoring wells are included as part of the current DNAPL recovery activities:

Well Name	Zone
MW-57A	A-TZ
MW-78A	A-TZ
MW-12B	B-TZ
MW-32B	B-CZ
MW-41B	B-TZ
MW-49B*	B-CZ
MW-57B	B-CZ
MW-68B*	B-TZ
MW-70B	B-CZ
MW-75B	B-CZ
MW-23C	C-TZ
MW-34CR	C-TZ
MW-44C	C-TZ
MW-45C	C-TZ
MW-46C	C-TZ

*Wells MW-49B and MW-68B were added to the list of recovery wells beginning in January 2020. The locations of the DNAPL recovery wells are shown on Figure 1.

The DNAPL recovery activities consist of measuring the depth to groundwater surface, the depth to groundwater/DNAPL interface, and the total depth of the well relative to the top of casing prior to DNAPL recovery. DNAPL recovery from each well is then performed using a peristaltic pump or submersible pump. On March 30, 2020, dedicated pneumatic DNAPL pumps were installed in recovery wells MW-12B and MW-41B. DNAPL is pumped from the bottom of each well until groundwater returns in the pump discharge. The volume of recovered DNAPL is estimated from each well based on the volume pumped, and the well is gauged to measure the total depth of the well and depth to DNAPL following pumping. Recovered DNAPL from all the wells is consolidated into a 55-gallon drum and temporarily stored at the Containment Storage Area pending disposal at the Clean Harbors Deer Park permitted facility in La Porte, Texas or US Ecology Robstown facility in Robstown, Texas. The most recent waste manifest for the disposal of recovered DNAPL and groundwater is provided in Attachment 1.

A summary of the DNAPL recovery measurements from February 2013 through June 2020 is provided in Table 1. DNAPL thicknesses listed on the table and referenced in this letter are “in-well thicknesses”. A graph of DNAPL thicknesses prior to each recovery effort over time from February 2013 through March 2020 is presented on Figure 2, with individual graphs for each zone and/or portion of the Site discussed below. Observations from the 1st Quarter 2020 gauging and recovery activities are provided below for each of the groundwater bearing units (GWBUs):

- A-TZ Wells: Two monitoring wells in the A-TZ have had measurable DNAPL detected: MW-57A and MW-78A (graph of DNAPL thickness from July 2018 through June 2020 shown on Figure 3).
    - **MW-57A:** No measurable DNAPL has been detected in MW-57A since August 2015. However, a trace of DNAPL was noted at MW-57A in January 2019 through May 2019, but not enough had accumulated in the well to be measured. No DNAPL was detected during the 1st and 2nd Quarter 2020.
    - **MW-78A:** DNAPL thickness in MW-78A in December 2019 had increased to approximately 5.42 feet. During the first half of 2020, DNAPL thicknesses fluctuated between from 0.39 to 3.49 feet with an increase to 5.45 feet at the end of June 2020.
- B-TZ Wells (West Side): Recovery wells MW-12B and MW- completed in the B-TZ were evaluated for DNAPL recovery during this period (graph of DNAPL thickness from July 2018 through June 2020 shown on Figure 4).
    - **MW-12B:** Beginning in early October 2019, DNAPL thickness in MW-12B increased to a historical peak of 27.08 feet thick (November 15, 2019) after the submersible pump used to recovery DNAPL from the well could no longer pump the NAPL, which appeared to become more viscous over time. NAPL thickness decreased to 18.08 feet thick through the end of December 2019. During the 1st Quarter of 2020, DNAPL thicknesses in MW-12B ranged from 19.08 feet (January 15, 2020) to 25.78 feet in February 2020. Recovery activities resumed at the end of March 2020 with the installation of the new pneumatic NAPL recovery pump. DNAPL thickness was between 24.19 and 27.08 feet during the first 3 recovery events with the new pump in the 2nd Quarter of 2020. Since

mid-May 2020, the DNAPL thickness in MW-12B has steadily decreased from 13.04 feet to 4.81 feet at the end of June 2020.

- **MW-41B:** From December 2019 through March 2020, DNAPL thickness has ranged from 1.31 feet thick to approximately 5.38 feet in MW-41B. In March 2020, DNAPL was measured to be 2.69 feet thick in MW-41B. Based on recent field observations, the DNAPL appeared to be more viscous similar to observations at MW-12B.

  Beginning in October 2019, the DNAPL found in MW-12B and MW-41B was becoming too thick for the submersible pump to recover the DNAPL. Two stainless steel pneumatic pulse pumps (gas displacement pumps) from QED Environmental Systems (model LP1301) were installed in MW-12B and MW-41B on March 30, 2020. These pumps are designed for recovering the increasingly more viscous liquids observed in these wells. Immediately following installation, 2.5 gallons of DNAPL from MW-12B and 2 gallons from MW-41B were recovered using the new pneumatic pumps.

  During a few of the recovery events after the new pump was installed in the 2nd Quarter of 2020, the top of the DNAPL was below the top of the pump at MW-41B, so it was not possible to record a DNAPL thickness. However, DNAPL was still recovered from MW-41B. The DNAPL thickness in MW-41B was estimated at 2.7 feet at the end of June 2020.

- B-TZ/B-CZ Wells (North (on-site and off-site)): Recovery wells MW-32B, MW-57B, MW-68B, and MW-70B completed in either the B-TZ or B-CZ on the north side of the Site or off-site to the north were evaluated for DNAPL recovery during this period (graph of DNAPL thickness from July 2018 through June 2020 shown on Figure 5).

  - **MW-32B:** During the 1st Quarter 2020, DNAPL thicknesses increased to levels fluctuating between 3.1 feet and 5.35 feet from January 2020 to late-March 2020. The DNAPL thickness in MW-32B increased to 6.26 feet in early April 2020 which was the thickest measurement recorded in the well since the beginning of DNAPL recovery efforts in February 2013. Since early April, DNAPL thicknesses have generally decreased to about 1.28 feet thick in late-June 2020.

  - **MW-57B:** Since June 2016, no measurable DNAPL has been detected in MW-57B. A trace amount of DNAPL was noted in MW-57B in January 2019 through May 2019, but no DNAPL has been detected since May 2019.

  - **MW-68B:** DNAPL was measured in MW-68B at approximately 3.59 feet thick in January 2020. DNAPL had not been detected in the well since installation in 2011; however, the boring log for the well indicated that NAPL was noted in the soil core from 34.5 to 35 feet below ground surface. Following bi-weekly recovery events from this well, the DNAPL thickness decreased to 0.9 feet thick by the end of March 2020. Approximately 1.9 gallons of DNAPL from MW-68B were recovered during the first quarter of 2020. DNAPL thickness ranged from 0.71 feet to 1.81 feet during the second quarter of 2020, and only trace amounts of DNAPL were able to be removed.

- **MW-70B:** During the 1st and 2nd Quarter 2020, DNAPL thicknesses have increased to levels fluctuating between 3.14 feet and 5.15 feet thick, which are some of the thickest measurements observed in the well. Since mid-May 2020, DNAPL thickness has decreased from 5.02 feet to 3.53 feet at the end of June 2020.

- B-TZ/B-CZ Wells (Englewood Intermodal Yard): Recovery wells MW-49B and MW-75B in the Englewood Intermodal Yard completed in the B-CZ were evaluated for DNAPL recovery during this period (graph of DNAPL thickness from July 2018 through June 2020 shown on Figure 6).

  - **MW-75B:** Measured DNAPL thicknesses during the 1st Quarter 2020 were greater than 2 feet in MW-75B in late-January, mid-February, and mid-March of 2020. However, in late-February and late-March, no DNAPL was observed in MW-75B. Trace DNAPL was detected in mid-March (0.05 feet-thick) and mid-June (0.15 feet thick) in MW-75B and was not detected during the other recovery events in the 2nd Quarter of 2020.

  - **MW-49B:** DNAPL had been previously measured in MW-49B in January and July 2013 (1.19 feet and 0.84 feet, respectively) and in July 2019 (0.24 feet). During the January 2020 semi-annual monitoring event, the measured apparent thickness of DNAPL in MW-49B was approximately 14.77 feet. Well MW-49B was added to the DNAPL recovery well network and recovery efforts began in mid-January 2020. DNAPL thickness decreased to 5.47 feet thick by the end of the quarter as a result of the bi-weekly recovery efforts. Approximately 8 gallons of DNAPL were recovered from MW-49B during the first quarter of 2020. During the second quarter of 2020, DNAPL thicknesses fluctuated between 2.81 feet and 3.82 feet, and approximately 1.6 gallons of DNAPL were removed.

- C-TZ Wells: Wells MW-23C, MW-34CR, MW-44C, MW-45C, and MW-46C completed in the C-TZ were evaluated for DNAPL recovery (graph of DNAPL thickness from July 2018 through June 2020 shown on Figure 7). .

  - **MW-23C:** In December 2019, DNAPL thicknesses in MW-23C was approximately 2.68 feet thick. DNAPL thickness decreased approximately 1 foot to 1.7 feet thick by the end of December 2019. During the 1st and 2nd Quarter 2020, DNAPL thickness in MW-23C fluctuated between 0.58 and 2.3 feet. DNAPL was not detected in mid-June and a trace amount (0.01 feet-thick) was noted in late-June 2020.

  - **MW-34CR:** In May 2014, replacement well MW-34CR was installed and gauged as part of the recovery program. However, no DNAPL has been detected in this well. The well pad was damaged in April 2019. In March 2020, MW-34CR well pad was repaired and no DNAPL was observed during the 2nd Quarter of 2020.

  - **MW-44C:** No measurable DNAPL had been detected in MW-44C from June 2019 (trace DNAPL noted in mid-June 2019) to May 2020. DNAPL was noted (0.39 feet thick) in MW-44C at the end of May 2020. However, it was discovered that the total depth measurement at MW-44C was approximately 10 feet higher than the well construction depth, suggesting that the well had

appeared to have silted up. MW-44C were re-developed during the site-wide monitoring activities in July 2020; these activities will be described in the 3rd Quarter 2020 report.

- **MW-45C:** DNAPL had not been detected in MW-45C between August 2015 and May 2020. In May 2020, DNAPL was 1.3 feet and 0.6 feet thick. DNAPL was not detected in June 2020.

- **MW-46C:** No measurable DNAPL has been observed in MW-46C since June 2019 (trace DNAPL noted in mid-June 2019).

- DNAPL Recovery: From February 2013 to June 2020, an estimated cumulative total of 772 gallons of creosote DNAPL have been recovered from the wells. Monthly DNAPL recovery volumes increased after the January 2015 event due to a change in pumping techniques. During the 2nd Quarter 2020, recovery has ranged from approximately 5.6 to 8.6 gallons per month (Table 1).

UPRR will continue to monitor the DNAPL thicknesses twice per month as discussed in the response to the TCEQ 4th Technical Notice of Deficiency (TNOD) letter (April 11, 2019).

If you have any questions or need additional information, please feel free to call me at (512) 671-3434 or Mr. Kevin Peterburs of UPRR at (414) 267-4164.

Sincerely,

Total DNAPL Pumped (gal)				***108.3***				***41.4***				***72.2***

Notes:

* - indicates DNAPL and groundwater mixture

MW-23C- added 5 feet to TOC due to capping after 2/3/2016

** - indicates DTD from previous event was used; DNAPL recovered revised based on review of field notes.

--- - No DNAPL pumped

ND - Not detected

DTW - Depth to water (feet Below Top of Casing (BTOC))

NM - Not measured

DTD - Depth to DNAPL (feet BTOC)

PoP - Product on probe, not measureable

MW-12B- TD measured at 46.2 instead of 45.8, August 28, 2015.

TR- Trace amount of DNAPL Extracted

Total DNAPL Pumped (gal)				***0***				***0***				***230.5***

Notes:

* - indicates DNAPL and groundwater mixture

** - indicates DTD from previous event was used

--- - No DNAPL pumped

DTW - Depth to water (feet Below Top of Casing (BTOC))

DTD - Depth to DNAPL (feet BTOC)

ND - Not detected

NM - Not measured

PoP - Product on probe, not measureable

TR- Trace amount of DNAPL Extracted

BP- Below pump; depth to DNAPL not measured because it is below top of in-well pump

Total DNAPL Pumped (gal)				***26.6***				***5.7***				***31.5***

Notes:

* - indicates DNAPL and groundwater mixture

--- - No DNAPL pumped

DTW - Depth to water (feet Below Top of Casing (BTOC))

DTD - Depth to DNAPL (feet BTOC)

ND - Not detected

NM - Not measured

PoP - Product on probe, not measureable

TR- Trace amount of DNAPL Extracted

MW-44C not measured 3/1/18 - 5/1/18; couldn't locate well due to construction.

**Total depth measured in MW-44C was approximately 10 ft higher than during previous events - will attempt to remove silt.

Total DNAPL Pumped (gal)				***9.6***				***15.5***				***2.7***

Notes:

* - indicates DNAPL and groundwater mixture

--- - No DNAPL pumped

DTW - Depth to water (feet Below Top of Casing (BTOC))

DTD - Depth to DNAPL (feet BTOC)

ND - Not detected

NM - Not measured

PoP - Product on probe, not measureable

TR- Trace amount of DNAPL Extracted

PROPOSED INSTITUTIONAL CONTROLS

On-Site PMZ Deed Restriction

DEED NOTICE

STATE OF TEXAS §
COUNTY OF § KNOW ALL MEN BY THESE PRESENTS THAT:
HARRIS §

This Notice is filed to provide information concerning certain environmental conditions and/or use restrictions pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the real property (Property) described as follows:

(Exhibit A, the legal description of the entire recorded tract of land held by UPRR including the former HWPW Area, Englewood Intermodal Yard, and railroad ballast area)

Portions of the soil and groundwater underlying the Property contain identified chemicals of concern causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property is described as follows:

(The Affected Property is more particularly described by metes and bounds on Exhibit A, attached hereto and incorporated herein by reference, and depicted on the map portion of Exhibit A.)

As detailed in the Response Action Plan (RAP) (Golder, 2020), target COCs in soil and groundwater media were detected within the Affected Property and Protective Concentration Level (PCL) Exceedance (PCLE) Zone in surface and subsurface soils.

PCLE Zones

Soils

Comparing the surface and subsurface soil analytical data to the appropriate critical PCLs, concentrations of 15 COCs exceeded their respective critical PCLs (cPCLs):

Surface Soils	cPCL (mg/kg)	Subsurface Soils	cPCL (mg/kg)
1,2-Diphenylhydrazine	0.23	2-Methylnaphthalene	378
2,4-Dinitrotoluene	0.049	Benzene	0.105
2-Methylnaphthalene	378	Naphthalene	192
Benzene	0.10	Pentachlorophenol	0.12
Benzo(a)anthracene	23		
Benzo(a)pyrene	2.36		
Dibenzofuran	743		
Naphthalene	189		
Pentachlorophenol	0.12		
Arsenic	200		
Lead	275		

Groundwater
Based on the most recent groundwater analytical data detailed in the RAP, concentrations of the following 19 target COCs exceeded their critical PCLs (cPCLs):

VOCs	cPCL for Class 2 Groundwater (mg/L)	cPCL for Class 3 Groundwater (mg/L)	SVOCs	cPCL for Class 2 Groundwater (mg/L)	cPCL for Class 3 Groundwater (mg/L)
Benzene	0.005	0.5	2,4-Dimethylphenol	1.5	150
			2,6-Dinitrotoluene	0.003	0.3
Metals			2-Methylnaphthalene	0.29	29
Arsenic	0.01	1	Acenaphthene*	4.4	440
			Acenaphthylene*	4.4	440
			Anthracene *	22	2200
			Benzo(a)anthracene	0.02	2
			Benzo(a)pyrene	0.0002	0.02
			Chrysene *	2	200
			Dibenzofuran	0.29	29
			Fluoranthene *	2.9	290
			Fluorene *	2.9	290
			Naphthalene	1.5	150
			Pentachlorophenol	0.001	0.1
			Phenanthrene	2.2	220
			Phenol	22	2200
			Pyrene *	2.2	220

* - COC only detected in wells with DNAPL present

Creosote DNAPL has been detected in the groundwater bearing units A-TZ, B-CZ, B-TZ, and C-TZ as noted in soil borings and monitoring wells.

This Notice is required for the following reasons:

Commercial/Industrial Land Use
The Affected Property currently meets TRRP standards for commercial/industrial land use, as the property may not be protective for residential use. If any person desires in the future to use the Property for residential purposes, the TCEQ must be notified at least 60 days in advance of such use and additional response actions may be necessary before the Property may be used for residential purposes. Persons contemplating a change in land use for the Property are encouraged to review the definitions for commercial/industrial and residential land use contained in TRRP as the definition of residential land use is broad.

Use of Physical Control on Soil
The Affected Property is subject to the TRRP requirements for properties containing concentrations of chemicals of concern in soil and is subject to the requirements in 30 TAC §350.33(e)(2) to prevent exposure to soils that contain a chemical of concern in excess of the protective concentration level. The attached Exhibit B describes and provides the location and

metes and bounds of the physical control and extent of the soil that exceeds the TCEQ-approved protective concentration levels for certain chemicals of concern. Physical controls include the following:

- Former HWPW Area:
    - Soil Cap Area: To protect on-site commercial/industrial receptors, a vapor barrier with geotextile fabric, and an engineered soil cap (12-in clayey soil, 6-in topsoil) was constructed to cover the consolidated soil and surface soil PCLE Zone on the former HWPW area. The soil cap is vegetated (with a pollinator /grass mix to attract pollinators in the area) and sloped to minimize infiltration over the surface/subsurface soil PCLE Zone. The vegetated cap will be maintained under the post-response action care.

    - Asphalt Roadway: For the South Drainage Ditch (SDD) (SWMU 2) along the southern boundary of the HWPW, an asphalt roadway was constructed to protect on-site commercial/industrial receptors in this area. Construction of the asphalt road will consist of grading the existing road material, compacting and stabilizing the existing road material, and applying a hot mix asphalt cover. The asphalt road will be maintained under the post-response action care.

- Englewood Intermodal Yard Area: The surface soil PCLE zone in the Intermodal Yard area is currently covered with a physical barrier (concrete pavement), preventing contact with the soil PCLE Zone and infiltration. A Non-Aqueous Phase Liquid (NAPL) Collection System was installed in January 2019 as an interim response action to address the tar-like material seeps and to recover NAPL sufficiently to eliminate NAPL discharge. The RACR for the NAPL Collection System dated March 26, 2019 (Golder, 2019) describes the response actions that were completed. UPRR is continuing to assess the effectiveness of the NAPL Collection System. Inspections of the NAPL Collection System are being conducted and updates are submitted to the TCEQ.

  Additional tar-like NAPL surface seeps and water seeps with dark brown to black water have been identified within the Englewood IM Yard. UPRR is in the process of developing responses for those areas. Test pits were excavated in July 2020 where tar NAPL seeps and seasonal black water seeps have been observed to evaluate the presence of NAPL and COCs in soil in those areas. Following the Interim NAPL Assessment (Golder, 2020) and test pit evaluation conducted in July 2020, additional investigations are necessary to evaluate potential impacts to the underground utilities within the Englewood IM Yard area.

- UPRR Main Lines Ballast Area: The area between the former HWPW area and the Englewood Intermodal Yard (approximately 100 feet width) is covered with railroad ballast, ties, and rail. The existing railroad ballast in this area will be used as an engineering control for preventing on-site worker exposure to impacted surface soils in this area. The railroad ballast area will be maintained as part of normal railroad operations. The track is owned and controlled by UPRR. In the event construction activities are necessary within the railroad ballast area, a health and safety plan will be

implemented to ensure worker protection from COCs in the surface soils and a soil management plan will be developed if soils are excavated as part of the construction activities.

In the event construction activities are necessary within the capped areas, a health and safety plan and soil management plan will be implemented to ensure worker protection from COCs in soils and proper management of impacted soils as part of the construction activities. The attached Exhibit C also describes the required maintenance and monitoring required for the physical control. This program must be implemented unless and until TCEQ approves any modification. This deed notice must not be removed or modified without prior approval from TCEQ.

Plume Management Zone

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone (PMZ). A PMZ is defined as an area of groundwater containing concentrations of COCs exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC §350.33(f)(4). The undersigned has established a PMZ so that the chemicals of concern in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the PMZ. The Response Action Plan (RAP) submitted for the Site describes the maintenance and monitoring required. The maintenance and monitoring is required until TCEQ approves some modification to those requirements. Exposure to groundwater within the PMZ for any purpose is not advised until such time that all of the chemicals of concern no longer exceed their respective PCLs. This deed notice must not be removed or modified without prior approval from TCEQ.

Non-Aqueous Phase Liquid

The Affected Property is subject to the TRRP requirements for the management of mobile NAPL. The attached Exhibit B provides the location and extent of the NAPL present at the Property. Drilling, excavation, and groundwater pumping within or into the NAPL zone is prohibited unless proper safeguards are taken to protect human health and safety from any hazards associated with the NAPL. Any NAPL removed during any future subsurface activity must be properly handled and managed in accordance with all applicable state and federal rules and regulations. This deed notice must not be removed or modified without prior approval from TCEQ.

As of the date of this notice, the record owner of fee title to the Property is
Union Pacific Railroad, with an address of 1400 Douglas Street, Omaha, Nebraska 68179.

For additional information, contact:

Austin, TX 78711-3087

TCEQ Program and Identifier No.: SWR 31547/IHW 50343

This Notice may be rendered of no further force or effect only by a superseding deed notice executed by the TCEQ or its successor agencies and filed in the same Real Property Records as those in which this Notice is filed.

EXECUTED this _____ day of _____, 20____.

Union Pacific Railroad [OWNER & RESPONDER]

By:_____

Name: Mr. Chris Goble
Title: Assistant Vice President of Real Estate
Union Pacific Railroad Company, a Delaware Corporation

STATE OF NEBRASKA §
DOUGLAS COUNTY §

BEFORE ME, on this the _____ day of _____, Mr. Chris Goble, Assistant Vice President of Real Estate, a representative of Union Pacific Railroad Company, a Delaware Corporation, known to me to be the person whose name is subscribed to the foregoing instrument, and he acknowledged to me that he executed the same for the purposes and consideration therein expressed.

GIVEN UNDER MY HAND AND SEAL OF OFFICE, this ___ day of _____, 20____.

_____

Notary Public in and for the State of Nebraska

County of _____

My Commission Expires: _____

EXHIBIT "A"
LEGAL DESCRIPTION OF AFFECTED PROPERTY

(to be surveyed following approval of Response Action Plan (RAP))

EXHIBIT "B"
LEGAL DESCRIPTION OF USE OF PHYSICAL CONTROL ON SOIL, EXTENT OF PMZ AND NAPL AREAS

(to be surveyed following approval of Response Action Plan (RAP))

EXHIBIT "C"

MAINTENANCE AND MONITORING OF THE PHYSICAL CONTROLS FOR SURFACE/SUBSURFACE SOIL

EXHIBIT "C"

MAINTENANCE AND MONITORING OF THE PHYSICAL CONTROLS FOR SURFACE/SUBSURFACE SOIL

The cap inspection and maintenance program will be developed to ensure the integrity of the cap and vegetative cover. The maintenance program will consist of the following:

I. Soil Cap Area - HWPW

VISUAL INSPECTIONS

Inspections will be performed on a quarterly basis and after all major storms. The inspections will focus on the following major issues:

1) Erosion of the cap (gullies, rills, or other erosional features on the cap surface or in drainages)
2) Sideslope sloughing (slippage)
3) Settling/subsidence
4) Vegetation deterioration
5) Damage from animals (i.e., rodents)
6) Groundwater monitoring equipment (wells) (semi-annual basis)

Locations where deficiencies are found shall be marked and repaired as soon as practicable.

MAINTAINING THE COVER AND VEGETATION

The cover and vegetation will be maintained by:

1) Preventing ponding
2) Maintaining design slopes and grades
3) Fertilizing, as necessary
4) Mowing, as necessary
5) Replanting, as necessary
6) Controlling animals (rodents, hogs) and insects

Routine repairs of the cover and maintenance of the slopes and grades will be performed to prevent ponding and drainage problems. Vegetation may require periodic application of fertilizer, mulch or seed. Vegetation will target pollinator seed mixes to attract pollinator species. Mowing will be performed as needed but less frequently than a grass covered cap and only periodically to promote the growth of desired vegetation and to block the growth of trees or shrubs which could penetrate the cover soil with their roots.

EROSION CONTROL

Maintenance of the drainage and diversion portions of the cap will be performed. Erosion of soil by water and/or wind will be repaired as soon as practicable.

II. Asphalt Roadway Area – HWPW

VISUAL INSPECTIONS

Inspections will be performed on a quarterly basis. The inspections will focus on the following major issues:

1) Erosion of the asphalt roadway (potholes, exposed soils)
2) Settling/subsidence

3) Cracks in asphalt roadway

Locations where deficiencies are found shall be marked and repaired as soon as practicable.

MAINTAINING THE ASPHALT ROADWAY

The asphalt cover will be maintained by:

1) Crack repair/sealing;
2) Pothole patching; and
3) Controlling vegetation.

III. Concrete Pavement – Englewood Intermodal Yard (On-Site)

VISUAL INSPECTIONS

Inspections will be performed on a quarterly basis. The inspections will focus on the following major issues:

1) Step separation in the concrete;
2) Settling/subsidence;
3) Cracks in the concrete; and
4) Openings in the pavement.

Locations where deficiencies are found shall be marked and repaired as soon as practicable.

MAINTAINING THE CONCRETE SIDEWALK/PAVEMENT

The concrete pavement will be maintained by:

1) Crack repair/sealing;
2) Replacing panels as needed; and
3) Controlling vegetation growing through cracks/along edges of sidewalk.

The following inspections and maintenance will be conducted for the NAPL Collection System constructed within the Englewood Intermodal Yard:

OPERATION/MAINTENANCE OF THE NAPL COLLECTION SYSTEM

1. Inspections will be conducted as needed to monitor the performance of the NAPL Collection System. The inspections will focus on the following major issues:
   - Tar-like material seeps in the vicinity of the NAPL Collection System;
   - Inspecting the NAPL collection sumps for NAPL accumulation;
   - Settling/subsidence;
   - Cracks in the concrete;
   - Locations where deficiencies are found shall be marked and repaired as soon as practicable.

2. If NAPL or fluids accumulate in the sumps, the NAPL and fluids will be recovered and disposed of at a permitted facility.

IV. Railroad Ballast Area – (HWPW/Englewood Intermodal Yard)

VISUAL INSPECTIONS

Inspections will be performed on a quarterly basis. The inspections will focus on the following major issues:

1) Ballast removed with exposed soil.

Locations where deficiencies are found shall be marked and repaired as soon as practicable.

MAINTAINING THE RAILROAD BALLAST

The railroad ballast will be maintained by:

1) Adding railroad ballast where areas of soil are exposed;
2) Controlling vegetation.

The ballast areas will be maintained in accordance with UPRR Engineering Standards for Roadbase Section for Wood Tie Track Construction (UPRR, 2006).

GROUNDWATER MONITORING

Groundwater monitoring will be conducted per the Groundwater Monitoring Plan described in RAP Worksheet 3.1. The results of groundwater monitoring will be submitted annually in the PRACR.

APPENDIX 5

LANDOWNER CONCURRENCE

Signed Restrictive Covenant – City of Houston Right-of-Way

RESTRICTIVE COVENANT

STATE OF TEXAS §
§ KNOW ALL MEN BY THESE PRESENTS THAT:
COUNTY OF HARRIS §

This Restrictive Covenant is filed to provide information concerning certain environmental conditions and use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the **City of Houston Right-of-Way - 0.1318 Acre Tract located within the Harris and Wilson 2 League Grant, Abstract 32 in Harris County, Texas** (Property) described in Exhibit A attached hereto and incorporated herein by reference.

Surface soil underlying the Property, which is presently covered in its entirety by a concrete sidewalk cap, contains certain identified chemicals of concern (COCs) causing the Property to be considered Affected Property as that term is defined in the TRRP.

This Restrictive Covenant is required for the following reasons:

Use of Physical Control on Soil

The Affected Property is subject to the TRRP requirements for properties containing concentrations of COCs in soil and is subject to the requirements in 30 TAC §350.33(e)(2) to prevent exposure to soils that contain a COC in excess of the protective concentration level. The attached Exhibit A describes and provides the location of the physical control and extent of the soil that exceeds the TCEQ-approved protective concentration levels for certain COCs. The attached Exhibit B lists the COCs that exceed the TCEQ's Protective Concentration Levels, provides the reason the physical control must remain in place, and describes the required maintenance and monitoring required for the physical control. This program must be implemented unless and until TCEQ approves any modification.

As of the date of this Restrictive Covenant, the City of Houston with an address of 901 Bagby Street, Houston, Texas 77002 owns a municipal right-of-way easement over the Property. Fee title underlying the easement is owned by the abutting property owner(s). In consideration of the Response Actions by Union Pacific Railroad (Responder) at the Former Houston Wood Preserving Works Site at 4910 Liberty Road, Houston, Texas (TCEQ SWR No. 31547), approval of the Response Action Completion Report, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the City of Houston has agreed, to the extent of its ownership interest, to place the following restrictions on the Property in favor of the TCEQ and the State of Texas, to-wit:

1. The removal or modification of the physical control on the Affected Property within the City of Houston ROW described in Exhibit A is prohibited without prior approval

from TCEQ and the physical control must be maintained and monitored by the Responder as described in Exhibit B. Removal or modification of this restrictive covenant is prohibited without prior approval of TCEQ.

2. These restrictions shall be a covenant running with the land.

EXHIBIT B

PHYSICAL CONTROL MAINTENANCE/MONITORING REQUIREMENTS

EXHIBIT "B"
MAINTENANCE AND MONITORING

Through the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program (TRRP), a Remedy Standard B remediation of the Property as detailed in the Response Action Plan (RAP) for the Union Pacific Railroad (UPRR) Houston Wood Preserving Works site (TCEQ SWR No. 31547/IHW Permit No. 50343) was implemented that included construction of a physical control using a concrete sidewalk cap (location detailed in Exhibit A). The concrete sidewalk was constructed following City of Houston Department of Public Works and Engineering Concrete Sidewalk Details for Streets with Curbs (07-01-2010). The concrete sidewalk will serve as a permanently placed cap atop contaminated soil present on the Property as defined in Exhibit A. The contaminated soil contains concentrations of chemicals of concern (COCs) benzo(a)pyrene and pentachlorophenol that exceed the TCEQ's Protective Concentration Levels. The concrete sidewalk cap will provide protection to human health and the environment throughout the post-closure care period.

UPRR will implement an inspection and maintenance program for the concrete sidewalk within the Property as shown on Exhibit A. The inspection and maintenance shall be conducted according to the Response Action Plan (RAP) dated November 21, 2014 (revised December 7, 2015) for the site or subsequently approved reports or TCEQ permits or written correspondence. Inspections will be performed by UPRR on a quarterly basis. The inspections will focus on evaluating the sidewalk for cracks or damage. If cracks are identified that allow exposure to the underlying soils, the cracks will be repaired and sealed in a manner consistent with the original plans and specifications following City of Houston guidelines for sidewalk construction. UPRR will submit annual reports to the TCEQ (unless this frequency is modified by subsequent TCEQ correspondence) documenting the inspections and any necessary repairs, maintenance, and/or replacement activities conducted to ensure the integrity of the physical control is being maintained and to ensure the continued effectiveness of the remedy.

RESTRICTIVE COVENANT

STATE OF TEXAS §
§ KNOW ALL MEN BY THESE PRESENTS THAT:
COUNTY OF HARRIS §

This Restrictive Covenant is filed to provide information concerning certain environmental conditions and use limitations pursuant to the Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program Rule (TRRP) found at 30 Texas Administrative Code (TAC), Chapter 350, and affects the **City of Houston Right-of-Way (ROW) (Property)** presented in Exhibits A-1 and A-2 attached hereto and incorporated herein by reference.

Portions of the groundwater underlying the Property contain certain identified chemicals of concern (COCs) causing those portions of the Property to be considered an Affected Property as that term is defined in the TRRP. The portion considered to be Affected Property and plume management zone, as those terms are defined in the TRRP, is shown on Exhibit B attached hereto and incorporated herein by reference.

This Restrictive Covenant is required for the following reasons:

Plume Management Zone

The Affected Property is subject to the TRRP requirements for properties with an area overlying a TCEQ-approved plume management zone. A plume management zone is defined as an area of groundwater containing concentrations of COCs exceeding the TCEQ-approved protective concentration levels for the site, plus any additional area allowed by the TCEQ in accordance with 30 TAC §350.33(f)(4). A plume management zone was established so that the COCs in the groundwater are managed such that human exposure is prevented and that other groundwater resources are protected. The attached Exhibit B provides the location and extent of the plume management zone. Exhibit C describes the maintenance and monitoring required and Table C-2 lists the COCs that exceed the TCEQ's Protective Concentration Levels. This maintenance and monitoring is required until TCEQ approves some modification of those requirements.

As of the date of this Restrictive Covenant, the City of Houston with an address of 901 Bagby Street, Houston, Texas 77002 owns municipal right-of-way easements over the Property. Fee title underlying the easements is owned by the abutting property owners. In consideration of the Response Actions by Union Pacific Railroad (Responder) at the Former Houston Wood Preserving Works Site at 4910 Liberty Road, Houston, Texas, approval of the Response Action Completion Report, and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the City of Houston has agreed, to the extent of its ownership interest, to place the following restrictions on the Property in favor of the TCEQ and the State of Texas, to-wit:

1. Exposure to groundwater underlying the Affected Property for any purpose is prohibited until such time when all of the chemicals of concern no longer exceed their respective protective concentration levels. The maintenance and monitoring described in Exhibit C is required to be performed by the Responder. Any modification of this restrictive covenant is prohibited without prior approval of TCEQ.

2. These restrictions shall be a covenant running with the land.

11.6378 ACRE CITY OF HOUSTON OFFSITE PMZ TRACT
HARRIS AND WILSON 2 LEAGUE GRANT, ABSTRACT 32
HARRIS COUNTY, TEXAS

BEING ALL THAT CERTAIN 11.6378 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being a portion of Liberty Road, right-of-way varies, all of 30 foot wide Lelia Street (11th Street), all of 60 foot wide Wylie Street (12th Street), all of 40 foot wide Clementine Street and all of 40 foot wide Fontinot Street, as shown on the map of the Subdivision of Shares 2 & 3 of the Gagne Homestead, according to the map or plat thereof recorded in Volume 1, Page 55 of the Harris County Map Records (H.C.M.R.), a portion of 60 foot wide Lucille Street, as shown on the map of Ballard Gardens Addition, according to the map or plat thereof recorded in Volume 1528, Page 725 of the Harris County Deed Records (H.C.D.R.), a portion of 50 foot wide Lucille Street and a portion of 50 foot wide Clementine Street (formerly Lots 1 and 10, Block 6) as shown on the map of Fairgrounds Park Annex according to the map or plat thereof recorded in Volume 499, Page 70 of the H.C.D.R., a portion of 50 foot wide Lucille Street, a portion of 50 foot wide Fontinot Street, and a portion of 50 foot wide Erastus Street as shown on the Map of Fair Ground Park Addition, according to the map or plat thereof recorded in Volume 81, Page 460 of the H.C.D.R., a portion of Old Lockwood Drive (right-of-way varies) as shown on the map of Kashmere Gardens Annex, according to the map or plat thereof recorded in Volume 996, Page 606 of the H.C.D.R., a portion of Cushing Street, a portion of Lockwood Drive, all of Lavender Street conveyed by deed recorded on May 24, 1948 from Carl S. Smith, et al to Harris County, as recorded in Volume 1740, Page 359 of the H.C.D.R., a portion of all that certain called 1.28 acre tract and a portion of all that certain called 1.20 acre tract of land conveyed by deed recorded on February 8, 1921 from W. N. Reece to Texas & New Orleans Railroad Company as recorded in Volume 465, Page 501 of the H.C.D.R.,; a portion of all that certain called 55,922 square foot tract of land and a portion of all that certain called 55,922 square foot tract of land conveyed by deed recorded on February 7, 1921 from W. N. Reece to Texas & New Orleans Railroad Company as recorded in Volume 472, Page 7 of the H.C.D.R., and a portion of all that certain called 5.79 acre tract of land conveyed by deed recorded on July 24, 1890 from R. B. Baer to Texas & New Orleans Railroad Company as recorded in Volume 50, Page 535 of the H.C.D.R., the herein described 11.6378 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

BEGINNING at 5/8" iron rod found marking the intersection of the southern right-of-way boundary line of said Liberty Road, right-of-way varies, with the northwestern right-of-way boundary line of the 100 foot wide Texas and New Orleans Rail Road Company right-of-way, same being the southeastern boundary line of said Texas and New Orleans Rail Road Company called 5.79 acre tract, said Point of Beginning being located at Texas State Plane coordinate X=3136759.96 and Y=13852340.99;

THENCE South 85°26'51" West, coincident with the southern boundary line of said Liberty Road, right-of-way varies, a distance of 1523.61 feet to a 5/8" iron rod found marking the point of curvature of a curve to the right, having a radius of 280.03 feet;

THENCE in a westerly direction, coincident with the southern boundary line of said Liberty Road, right-of-way varies, along said curve to the right, having a radius of 280.03 feet, an arc length of 35.84 feet, a central angle of 7°20'01", a chord bearing and distance of South 89°06'52" West – 35.82 feet to the southwest corner of the herein described 11.6378 acre tract;

THENCE North 2°07'09" West, crossing said Liberty Road, right-of-way varies, a distance of 61.06 feet to a point located on the northern right-of-way boundary line of said Liberty Road, right-of-way varies, for the southwest corner of Tract 1, Block 2 of the unrecorded subdivision of Liberty Road Estates, being the same tract conveyed by deed recorded on March 27, 2014 from Harris County, et al to 2013 Cottage, LLC, as recorded in Clerk's File No. 20140123340 of the H.C.O.R., located on a curve to the left, having a radius of 208.77 feet, for an angle corner of the herein described 11.6378 acre tract,

131 Commerce Street • Clute, Texas 77531-5601
Phone: 979-265-3622 • Fax: 979-265-9940 • Email: DW-Surveyor.com

THENCE in an easterly direction, coincident with northern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the southern boundary line of said Tract 1, Block 2 of the unrecorded subdivision of Liberty Road Estates, along said curve to the left, having a radius of 208.77 feet, an arc length of 37.18 feet, a central angle of 10°12'15", a chord bearing and distance of South 89°27'07" East – 37.13 feet to a point for corner;

THENCE North 85°26'48" East, coincident with northern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the southern boundary line of said Tract 1, Block of the unrecorded subdivision of Liberty Road Estates, a distance of 178.31 feet to the intersection of the northern right-of-way boundary line of said Liberty Road, right-of-way varies, and the western right-of-way boundary line of said Lavender Street, for the southeast corner of said Lot 1, Block 2 of the unrecorded subdivision of Liberty Road Estates, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°32'05" West, coincident with the western right-of-way boundary line of said Lavender Street, same being the eastern boundary line of Tract 1, the eastern boundary line of Lot 16, being the same tract conveyed by deed recorded on July 2, 1952 from Clark Investment Company to John Ellis, etux as recorded in Volume 2458, page 665 of the H.C.D.R., the eastern boundary line of Tract 14, being the same tract conveyed by deed recorded on March 27, 2014 from Harris County, et al to 2013 Cottage, LLC, as recorded in Clerk's File No. 20140123340 of the H.C.O.R., the eastern boundary line of Tract 13, being the same tract conveyed by deed recorded on May 11, 2001 from Larry Charles Wyatt to Francis A. Wyatt, as recorded in Clerk's File No. V045715 of the H.C.O.R., and the eastern boundary line of Tract 12, being the same tract conveyed by deed recorded on February 16, 1950 from Clark Investment Company to Arthur Brooks, etux as recorded in Volume 2035, Page 571 of the H.C.D.R., all being out of Block 2, of the unrecorded subdivision of Liberty Road Estates, a distance of 564.44 feet to a point located on the southern boundary line of Lot 5 of said Ballard Gardens Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°02'09" East, coincident with the southern boundary line of Lot 5 and Lot 6 of said Ballard Gardens Addition, a distance of 50.00 feet to the northwest corner of Tract 11 of the unrecorded subdivision of Liberty Road Estates, being the same tract conveyed by deed recorded on January 28, 2003 from Harris County, et al to Sandra Rena Thompson, as recorded in Clerk's File NO. W386946 of the H.C.O.R., for an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°32'08" East, coincident with the eastern right-of-way boundary line of said 50 foot wide Lavender Street, same being the western boundary line of said Tract 11, Tract 6A, being the same tract conveyed by deed recorded on September 24, 1993 from Clark Investment Company, Inc. to Essie Lee Hutchins as recorded in Clerk's File No. P469225 of the H.C.O.R., Tract 6B, in the name of Zearlene Osborne, recordation information not found, Tract 6 and Tract 6C, in the name of Lucille Long, recordation information not found, Tract 5, being the same tract conveyed by deed recorded on March 1, 2011 from Constable Jack F. Abercia, Precinct 1, Harris County, Texas to Greater Mount Nebo Baptist Church as recorded in Clerk's File No. 2011-083443 of the H.C.O.R., Tract 4, being the same tract conveyed by deed recorded on August 14, 2009 from Jack Anthony Coachman to Ray Carrington as recorded in Clerk's File No. 2009-0369151 of the H.C.O.R., Tract 3, being the same tract described in deed recorded on November 22, 1951 from Clark Investment Company to Jessie Beal, et al, as recorded in Volume 2344, Page 164 of the H.C.D.R., and Tract 1, being the same tract conveyed by deed recorded on August 5, 2013 from Constable Alan Rosen Precinct 1, Harris County, Texas to Greater Mount Nebo Missionary Baptist Church, as recorded in Clerk's File No. 2013-0394211 of the H.C.O.R., all being out of Block 2 of the unrecorded subdivision of Liberty Road Estates, a distance of 563.05 feet to the intersection of the eastern right-of-way boundary line of said 50 foot wide Lavender Street with the northern right-of-way boundary line Liberty Road, right-of-way varies, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 85°26'48" East, coincident with the northern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the southern boundary line of said Tract 1 of the unrecorded subdivision of Liberty Road Estates and the southern boundary line of Block 6 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 312.60 feet to the southeast corner of said Block 6, same being the intersection of the northern right-of-way boundary line of said Liberty Road, right-of-way varies, with the western right-of-way boundary line of 40 foot wide Clementine Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°36'42" West, coincident with the western right-of-way boundary line of said 40 foot wide Clementine Street, same being the eastern boundary line of Block 6 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 258.61 feet to the northeast corner of said Block 6, same being the intersection of said western right-of-way boundary line of 40 foot wide Clementine Street with the southern right-of-way boundary line of 60 foot wide Wylie Street (12th Street), for an angle corner of the herein described 11.6378 acre tract;

THENCE South 87°19'08" West, coincident with the southern right-of-way boundary line of 60 foot wide Wylie Street (12th Street), same being the northern boundary line of Block 6 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 205.77 feet to the northwest corner of said Block 6, located on the eastern boundary line of said unrecorded subdivision of Liberty Road Estates, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°32'05" West, coincident with the eastern boundary line of said unrecorded subdivision of Liberty Road Estates, a distance of 59.94 feet to the southwest corner of Block 1, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, located on the northern boundary line of said 60 foot wide Wylie Street (12th Street), for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°19'08" East, coincident with the northern boundary line of said 60 foot wide Wylie Street (12th Street), same being the southern boundary line of Block 1 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 205.69 feet, to the southeast corner of said Block 1, at the intersection of the northern right-of-way boundary line of said Wylie Street (12th Street) with the western right-of-way boundary line of said 40 foot wide Clementine Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°36'42" West, coincident with the western right-of-way boundary line of said 40 foot wide Clementine Street, same being the eastern boundary line of Block 1 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 201.16 feet to the northeast corner of said Block 1, at the intersection of the western boundary line of said 40 foot wide Clementine Street with the southern right-of-way boundary line of called 30 foot wide Lelia Street (11th Street), for an angle corner of the herein described 11.6378 acre tract;

THENCE South 87°25'50" West, coincident with the southern right-of-way boundary line of called 30 foot wide Lelia Street (11th Street), same being the northern boundary line of Block 1 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 205.42 feet, to the northwest corner of said Block 1, located on the eastern boundary line of said unrecorded subdivision of Liberty Road Estates, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°32'05" West, coincident with the eastern boundary line of said unrecorded subdivision of Liberty Road Estates, a distance of 39.50 feet, to a point located on the northern right-of-way boundary line of said called 30 foot wide Lelia Street (11th Street), same being the southern boundary line of Lot 8 of said Ballard Gardens Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 86°39'32" East, coincident with the northern right-of-way boundary line of said called 30 foot wide Lelia Street (11th Street), same being the southern boundary line of said Lot 8 of Ballard Gardens Subdivision and the southern boundary line of Block 6 of said Fairgrounds Park Annex, a distance of 224.33 feet to the intersection of the northern right-of-way boundary line of said called 30 foot wide Lelia Street with the western right-of-way boundary line 50 foot wide Clementine Street, formerly Lots 1 and 10, Block 6, Fairgrounds Park Annex, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°13'09" West, coincident with the western right-of-way boundary line 50 foot wide Clementine Street, a distance of 148.26 feet, to a point located at the intersection of the western right-of-way boundary line of said 50 foot wide Clementine Street with the southern right-of-way boundary line of 50 foot wide Lucille Street, same being the northern boundary line of Block 6 of said Fairground Park Annex, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 87°15'00" West, coincident with the southern right-of-way boundary line of 50 foot wide Lucille Street, same being the northern boundary line of Block 6 of said Fairground Park Annex, a distance of 214.01 feet, to the northwest corner of said Block 6 of Fairground Park Annex, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°13'09" East, coincident with the western boundary line of said Block 6 of Fairground Park Annex, a distance of 19.17 feet, to the northeast corner of Lot 8 of said Ballard Gardens Addition, located on the southern right-of-way boundary line of 60 foot wide Lucille Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 87°04'51" West, coincident with the southern right-of-way boundary line of 60 foot wide Lucille Street, same being the northern boundary line of Lot 8 and Lot 7 of said Ballard Gardens Addition, a distance of 114.00 feet to an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°13'09" West, a distance of 60.00 feet to a point located on the northern right-of-way boundary line of said 60 foot wide Lucille Street, same being the southern boundary line of Lot 15 of said Ballard Gardens Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°04'51" East, coincident with the northern right-of-way boundary line of said 60 foot wide Lucille Street, same being the southern boundary line of Lots 15 and 16 of said Ballard Gardens Addition, a distance of 115.34 feet, to an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°36'44" West, coincident with the eastern boundary line of said Lot 16 of Ballard Gardens Addition, a distance of 11.16 feet to the southwest corner of Block 5 of said Fairgrounds Park Annex, located on the northern right-of-way boundary line of said 50 foot wide Lucille Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°35'59" East, coincident with the northern right-of-way boundary line of said 50 foot wide Lucille Street, same being the southern boundary line of Block 5 of said Fairgrounds Park Annex and the southern boundary line of Block 2 of Fair Ground Park Addition, a distance of 412.65 feet to the southeast corner of said Block 2 of said Fair Ground Park Addition at the intersection of the northern right-of-way boundary line of said 50 foot wide Lucille Street with western right-of-way boundary line of 50 foot wide Fontinot Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°18'06" West, coincident with the western right-of-way boundary line of said 50 foot wide Fontinot Street, same being the eastern boundary line Block 2 of said Fair Ground Park Addition, a distance of 200.00 feet, to the intersection of the western right-of-way boundary line of said 50 foot wide Fontinot Street with the southern right-of-way boundary line of 50 foot wide Jewel Street, for angle corner;

THENCE North 87°48'32" East, coincident with the southern right-of-way boundary line of 50 foot wide Jewel Street, a distance of 50.40 feet, to a point located at the intersection of the southern right-of-way boundary line of said 50 foot wide Jewel Street with the eastern right-of-way boundary line of 50 foot wide Fontinot Street, for the northwest corner of Block 7 of said Fair Ground Park Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°24'01" East, coincident with the eastern right-of-way boundary line of 50 foot wide Fontinot Street, same being the western boundary line of Block 7 of said Fair Ground Park Addition, a distance of 200.28 feet to the southwest corner of said Block 7, at the intersection of the eastern right-of-way boundary line of 50 foot wide Fontinot Street with the northern right-of-way boundary line of said 50 foot wide Lucille Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°31'57" East, coincident with the northern right-of-way boundary line of 50 foot wide Lucille Street, same being the southern boundary line of Block 7 of said Fair Ground Park Addition, a distance of 199.11 feet to an angle corner of the herein described 11.6378 acre tract;

THENCE South 3°23'23" East, a distance of 46.11 feet, to a point located southern right-of-way boundary line of 50 foot wide Lucille Street, same being the northern boundary line of Block 8 of said Fair Ground Park Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 86°40'09" West, coincident with the southern right-of-way boundary line of 50 foot wide Lucille Street, same being the northern boundary line of Block 8 of said Fair Ground Park Addition, and the northern boundary line of Block 1 as shown on the map of the Greater True Vine Missionary Baptist Church recorded in Film Code 599251 of the H.C.M.R., a distance of 184.90 feet the north corner of a cutback at the intersection of the southern right-of-way boundary line of said 50 foot wide Lucille Street with the eastern right-of-way boundary line of said 50 foot wide Fontinot Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 41°40'02" West, coincident with the said cutback, a distance of 21.21 feet, to a point located on the eastern right-of-way boundary line of said 50 foot wide Fontinot Street, same being the western boundary line of Block 1 of said Greater True Vine Missionary Baptist Church, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 3°20'11" East, coincident with the eastern right-of-way boundary line of said 50 foot wide Fontinot Street, same being the western boundary line of Block 1 of said Greater True Vine Missionary Baptist Church, a distance of 115.26 feet, to a point located at the North corner of a cutback at the intersection of the eastern right-of-way boundary line of said 50 foot wide Fontinot Street with the northern right-of-way boundary line of 50 foot wide Lelia Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 48°20'07" East, coincident with said cutback, a distance of 21.21 feet, to the intersection of the eastern right-of-way boundary line of said 50 foot wide Fontinot Street with the northern right-of-way boundary line of 50 foot wide Lelia Street, located on the southern boundary line of said Block 1 of said Greater True Vine Missionary Baptist Church, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 86°39'53" East, coincident with the northern right-of-way boundary line of called 30 foot wide Lelia Street, same being the southern boundary line of said Block 1 of said Greater True Vine Missionary Baptist Church, a distance of 135.00 feet, to a point located on the western boundary line of Lot 3, Block 8 of said Fair Ground Park Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 3°32'04" East, coincident with the western boundary line of said Lot 3, Block 8 of Fair Ground Park Addition, a distance of 5.22 feet, to a point located on the northern right-of-way boundary line of called 30 foot wide Lelia Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 86°39'22" East, coincident with the northern right-of-way boundary line of called 30 foot wide Lelia Street, same being the southern boundary line of Block 8, Fair Ground Park Addition, a distance of 152.41 feet to the southeast corner of said Block 8, located at the intersection of the northern right-of-way boundary line of called 30 foot wide Lelia Street, with the western right-of-way boundary line of called 50 foot wide Erastus Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 3°28'13" West, coincident with the western right-of-way boundary line of called 50 foot wide Erastus Street, same being the eastern boundary line of Block 8 of Fair Ground Park Addition, a distance of 96.31 feet, to an angle corner of the herein described 11.6378 acre tract;

THENCE North 86°39'22" East, a distance of 48.05 feet, to a point located on the eastern right-of-way said called 50 foot wide Erastus Street, same being the western boundary line of Block 11 of said Fair Ground Park Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°30'35" East, coincident with the eastern right-of-way of said called 50 foot wide Erastus Street, the western boundary line of Block 11 and the western boundary line of Block 10 of said Fair Ground Park Addition, a distance of 401.08 feet, to the southwest corner of said Block 10, located at the intersection of the eastern right-of-way boundary line of said called 50 foot wide Erastus Street with the northern boundary line of 50 foot wide Wylie Street, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°22'50" East, coincident with the northern right-of-way boundary line of said 50 foot wide Wylie Street, same being the southern boundary line of said Block 10, Fair Ground Park Addition, a distance of 249.79 feet, to a point located on the western right-of-way boundary line of Cushing Street, located on the eastern boundary line of Lot 11, Block 10 of Fair Ground Park Addition, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°23'24" West, coincident with the western boundary right-of-way boundary line of said Cushing Street, same being the eastern boundary line of Lot 11, Block 10 of Fair Ground Park Addition, a distance of 100.05 feet, to the northeast corner of said Lot 11, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°23'16" East, crossing said Cushing Street and Lockwood Drive, a distance of 304.42 feet, to a point located on the eastern right-of-way boundary line of Lockwood Drive, same being the western boundary line of the residual of Lot 1939 of Kashmere Gardens Annex, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 10°38'10" East, coincident with the eastern right-of-way boundary line of Lockwood Drive, same being the western boundary line of the residual of said Lot 1939 of Kashmere Gardens Annex, a distance of 5.08 feet, to the southwest corner of the residual of said Lot 1939 and the northwest corner of the residual of Lot 1938, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 6°16'50" East, coincident with the eastern right-of-way boundary line of Lockwood Drive, same being the western boundary line of the residual of said Lot 1938 of Kashmere Gardens Annex, and the western boundary line of all that certain called 0.3790 acre tract conveyed by deed recorded on August 31, 1979 from Larry Edward, et al to Martin Damian,. Sr., et al as recorded in Clerk's File No. G222792 of the H.C.O.R., a distance of 75.22 feet to an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°06'20" East, coincident with the eastern right-of-way boundary line of Lockwood Drive, same being the western boundary line of said Martin Damian, Sr., et al called 0.3790 acre tract, a distance of 101.23 feet, to a point located on the northern right-of-way boundary line of said Liberty Road, right-of-way varies, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 62°01'40" East, coincident with the northern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the southern boundary line of said Martin Damian, Sr., et al called 0.3790 acre tract, a distance of 145.35 feet to the southeast corner of said Martin Damian, Sr., et al called 0.3790 acre tract, located at the intersection of the northern right-of-way boundary line of said Liberty Road with the western right-of-way boundary line of Old Lockwood Drive, right-of-way varies, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 1°22'20" West, coincident with the western right-of-way boundary line of Old Lockwood Drive, right-of-way varies, same being the eastern boundary line of said Martin Damian, Sr., et al called 0.3790 acre tract, a distance of 20.77 feet to an angle corner of the herein described 11.6378 acre tract;

THENCE South 89°43'40" West, coincident with the northern boundary line of said Martin Damian, Sr., et al called 0.3790 acre tract, a distance of 30.03 feet, to a point located on the western right-of-way boundary line of said Old Lockwood Drive, right-of-way varies, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 2°32'15" West, coincident with the western right-of-way boundary line of said Old Lockwood Drive, right-of-way varies, same being the eastern boundary line of said Martin Damian, Sr., et al called 0.3790 acre tract and the residual of said Lot 1938 of Kashmere Gardens Annex, a distance of 92.46 feet, to an angle corner of the herein described 11.6378 acre tract;

THENCE North 87°23'53" East, crossing said Old Lockwood Drive, right-of-way varies, a distance of 131.87 feet, to a point located on the eastern right-of-way boundary line of said Old Lockwood Drive, right-of-way varies, same being the western boundary line of all certain called 1.0467 acre tract, conveyed by deed recorded on October 20, 2006 from Elmer Preston, trustee to Rosendo H. Hernandez ass recorded in Clerk's File No. 2006-0140564 of the H.C.O.R., for an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°48'39" East, coincident with the eastern right-of-way boundary line of said Old Lockwood Drive, right-of-way varies, same being the western boundary line of said Rosendo H. Hernandez called 1.0467 acre tract, a distance of 51.59 feet to an angle corner of the herein described 11.6378 acre tract;

THENCE South 19°53'48" East, coincident with the eastern right-of-way boundary line of said Old Lockwood Drive, right-of-way varies, same being the western boundary line of said Rosendo H. Hernandez called 1.0467 acre tract, a distance of 12.60 feet to the southwest corner of said Rosendo H. Hernandez called 1.0467 acre tract, at the intersection of the eastern right-of-way boundary line of said Old Lockwood Drive right-of-way varies, with the northern right-of-way boundary line of Liberty Road, right-of-way varies, for an angle corner of the herein described 11.6378 acre tract;

THENCE North 62°25'57" East, coincident with the northern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the southern boundary line of said Rosendo H. Hernandez called 1.0467 acre tract, a distance of 145.44 feet, to an angle corner of the herein described 11.6378 acre tract;

THENCE South 2°50'20" East, crossing said Liberty Road, right-of-way varies, a distance of 111.49 feet, to a point located on the southern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the northern right-of-way boundary line of said 100 foot wide Texas and New Orleans Rail Road Company right-of-way, for an angle corner of the herein described 11.6378 acre tract;

THENCE South 62°10'18" West, coincident with the southern right-of-way boundary line of said Liberty Road, right-of-way varies, same being the northern right-of-way boundary line of said 100 foot wide Texas and New Orleans Rail Road Company right-of-way, a distance of 629.98 feet to the **POINT OF BEGINNING,** containing within this description 18.2271 acres of land, less and except the following tracts, being more particularly described as follow: Tract 1 – 0.4989 acre tract, Tract 2 – 1.1343 acre tract, Tract 3 – 1.1138 acre tract, Tract 4 – 1.4501 acre tract, Tract 5, 1.3385 acre tract, Tract 6 – 1.0537 acre tract, leaving a net acreage of 11.6378 acres, more or less.

LESS & EXCEPT TRACT 1 – 0.4989 ACRE

BEING ALL THAT CERTAIN 0.4989 ACRE tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being a portion of Lot 1 and all of Lot 3 of Fair Ground Park Addition, according to the map or plat thereof recorded in Volume 81, Page 460 of the Harris County Deed Records (H.C.D.R.), and being all of Block 2 of the Greater True Vine Missionary Baptist Church according to the map or plat thereof recorded in Film Code 599251 of the Harris County Map Records, the herein described 0.4989 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the southeast corner of Block 2 of said Fair Ground Park Addition, located on the intersection of the northern right-of-way boundary line 50 foot wide Lucille Street and the western boundary line of 50 foot wide Fontinot Street, said Point of Commencement being located at Texas State Plane coordinate position X=3135965.22 and Y=13853093.15;

THENCE South 2°57'04" East, crossing said 50 foot wide Lucille Street, a distance of 50.68 feet to the northeast corner of said Block 1 Fair Grounds Park Addition for the northeast corner and the **POINT OF BEGINNING** of the herein described 0.4989 acre tract, at position X=3135967.82 and Y=13853042.55;

THENCE South 3°20'56" East, coincident with the western boundary line of said 50 foot wide Fontinot Street, same being the eastern boundary line of said Block 1, Fair Ground Park Addition, and the eastern boundary line of said Block 2 of the subdivision of the Greater True Vine Missionary Baptist Church, a distance of 130.37 feet to the North corner of a cutback at the southeast corner of said Block 2, located at the intersection of the western boundary line of said 50 foot wide Fontinot Street with the northern right-of-way boundary line of Lelia Street, for an angle corner of the herein described 0.4989 acre tract;

THENCE South 41°35'58" West, coincident with said cutback, a distance of 21.21 feet to the intersection of the western right-of-way boundary line of said 50 foot wide Fontinot Street with the northern right-of-way boundary line of called 30 foot wide Lelia Street, for an angle corner of the herein described 0.4989 acre tract;

THENCE South 86°39'32" West, coincident with the northern right-of-way boundary line of called 30 foot wide Lelia Street, same being the southern boundary of said Block 2 of the subdivision of the Greater True Vine Missionary Baptist Church and the southern boundary line of Block 1 of said Fair Ground Park Addition, a distance of 135.28 feet to the southwest corner of said Block 1 of said Fair Ground Park, located at the intersection of the northern right-of-way boundary line of said called 30 foot wide Lelia Street, with the eastern right-of-way boundary line of 50 foot wide Clementine Street, for the southwest corner of the herein described 0.4989 acre tract;

THENCE North 3°13'55" West, coincident with the eastern right-of-way boundary line of 50 foot wide Clementine Street, a distance of 145.64 feet to the northwest corner of Block 1 of Fair Ground Park Addition, located at the intersection of the eastern right-of-way boundary line of said 50 foot wide Clementine Street with the southern right-of-way boundary line of said 50 foot wide Lucille Street, for the northwest corner of the herein described 0.4989 acre tract;

THENCE North 86°45'15" East, coincident with the southern right-of-way boundary line of said 50 foot wide Lucille Street, a distance of 149.97 feet to the **POINT OF BEGINNING,** containing 0.4989 acre of land, more or less.

LESS & EXCEPT TRACT 2 – 1.1343 ACRE TRACT

BEING ALL THAT CERTAIN 1.1343 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being all of Block 2 as shown on the map of the Subdivision of Shares 2 & 3 of the Gagne Homestead, according to the map or plat thereof recorded in Volume 1, Page 55 of the Harris County Map Records, the herein described 1.1343 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the northeast corner of Block 1 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, said point being the intersection of the southern right-of-way boundary line of called 30 foot wide Lelia Street, with the eastern right-of-way boundary line of 40 foot wide Clementine Street, said Point of Commencement being located at Texas State Plane coordinate position X=3135755.89 and Y=13852842.23;

THENCE North 88°54'44" East, crossing said 40 foot wide Clementine Street, a distance of 40.01 feet to the northwest corner of said Block 1 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, at the intersection of the southern right-of-way boundary line of called 30 foot wide Lelia Street, with the western right-of-way boundary line of 40 foot wide Clementine Street, for the northwest corner and the **POINT OF BEGINNING** herein described 1.1343 acre tract, at position X=3135795.90 and Y=13852842.99;

THENCE North 87°19'08" East, coincident with the southern boundary line of said called 30 foot wide Lelia Street, same being the northern boundary line of said Block 1, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 246.99 feet to the northeast corner of said Block 1, at the intersection of the southern boundary line of said called 30 foot wide Lelia Street, with the western boundary line of 40 foot wide Fontinot Street, for the northeast corner of the herein described 1.1343 acre tract

THENCE South 2°36'42" East, coincident with the western boundary line of 40 foot wide Fontinot Street, same being the eastern boundary line of said Block 1, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 200.05 feet to the southeast corner of said Block 1, located at the intersection of the western boundary line of 40 foot wide Fontinot Street with the northern right-of-way boundary line 50 foot wide Wylie Street, for the southeast corner of the herein described 1.1343 acre tract

THENCE South 87°19'08" West, coincident with the northern right-of-way boundary line 50 foot wide Wylie Street, same being the southern boundary line of said Block 1, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 246.99 feet to the southwest corner of said Block 1, at the intersection of the northern right-of-way boundary line of said 50 foot wide Wylie Street with the eastern right-of-way boundary line of 40 foot wide Clementine Street, for the southwest corner of the herein described 1.1343 acre tract

THENCE North 2°36'42" West, coincident with the eastern right-of-way boundary line of 40 foot wide Clementine Street, same being the western boundary line of said Block 1, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 200.05 feet to the **POINT OF BEGINNING**, containing 1.1343 acres of land, more or less.

LESS & EXCEPT TRACT 3– 1.1138 ACRE TRACT

BEING ALL THAT CERTAIN 1.1138 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being all of Block 3 as shown on the map of the Subdivision of Shares 2 & 3 of the Gagne Homestead, according to the map or plat thereof recorded in Volume 1, Page 55 of the Harris County Map Records, the herein described 1.1138 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the northeast corner of Block 2 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, said point being the intersection of the southern right-of-way boundary line of called 30 foot wide Lelia Street, with the eastern right-of-way boundary line of 40 foot wide Fontinot Street, said Point of Commencement being located at Texas State Plane coordinate position X=3136042.59 and Y=13852854.55;

THENCE North 87°19'08" East, crossing said 40 foot wide Fontinot Street, a distance of 40.00 feet to the northwest corner of said Block 3 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, at the intersection of the southern right-of-way boundary line of called 30 foot wide Lelia Street, with the western right-of-way boundary line of 40 foot wide Fontinot Street, for the northwest corner and the **POINT OF BEGINNING** herein described 1.1138 acre tract, at position X=3136082.54 and Y=13852856.42;

THENCE North 87°19'08" East, coincident with the southern boundary line of said called 30 foot wide Lelia Street, same being the northern boundary line of said Block 3, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 243.60 feet to the northeast corner of said Block 3, at the intersection of the southern boundary line of said called 30 foot wide Lelia Street, with the western boundary line of Erastus Street, right-of-way varies, for the northeast corner of the herein described 1.1138 acre tract

THENCE South 1°59'48" East, coincident with the western boundary line of Erastus Street, right-of-way varies, same being the eastern boundary line of said Block 3, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 200.06 feet to the southeast corner of said Block 3, located at the intersection of the western boundary line of Erastus Street, right-of-way varies, with the northern right-of-way boundary line 50 foot wide Wylie Street, for the southeast corner of the herein described 1.1138 acre tract

THENCE South 87°19'08" West, coincident with the northern right-of-way boundary line 50 foot wide Wylie Street, same being the southern boundary line of said Block 3, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 241.45 feet to the southwest corner of said Block 3, at the intersection of the northern right-of-way boundary line of said 50 foot wide Wylie Street with the eastern right-of-way boundary line of 40 foot wide Fontinot Street, for the southwest corner of the herein described 1.1138 acre tract

THENCE North 2°36'42" West, coincident with the eastern right-of-way boundary line of 40 foot wide Fontinot Street, same being the western boundary line of said Block 3, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 200.05 feet to the **POINT OF BEGINNING**, containing 1.1138 acres of land, more or less.

LESS & EXCEPT TRACT 4- 1.4501 ACRE TRACT

BEING ALL THAT CERTAIN 1.4501 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being all of Block 5 as shown on the map of the Subdivision of Shares 2 & 3 of the Gagne Homestead, according to the map or plat thereof recorded in Volume 1, Page 55 of the Harris County Map Records, the herein described 1.4501 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the northeast corner of Block 6 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, said point being the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street with the eastern right-of-way boundary line of 40 foot wide Clementine Street, said Point of Commencement being located at Texas State Plane coordinate position X=3135767.79 and Y=13852581.43;

THENCE North 87°19'08" East, crossing said 40 foot wide Clementine, a distance of 37.63 feet to the northwest corner of said Block 5 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, at the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street, with the western right-of-way boundary line of 40 foot wide Clementine Street, for the northwest corner and the **POINT OF BEGINNING** herein described 1.4501 acre tract, at position X=3135805.06 and Y=13852583.18;

THENCE North 87°19'08" East, coincident with the southern boundary line of said 50 foot wide Wylie Street, same being the northern boundary line of said Block 5, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 249.36 feet to the northeast corner of said Block 5, at the intersection of the southern boundary line of said 50 foot wide Wylie Street, with the western boundary line of 40 foot wide Fontinot Street, for the northeast corner of the herein described 1.4501 acre tract;

THENCE South 2°36'42" East, coincident with the western boundary line of 40 foot wide Fontinot Street, same being the eastern boundary line of said Block 5, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 249.24 feet to the southeast corner of said Block 5, located at the intersection of the western boundary line of 40 foot wide Fontinot Street with the northern right-of-way boundary line Liberty Road, right-of-way varies, for the southeast corner of the herein described 1.4501 acre tract;

THENCE South 85°26'51" West, coincident with the northern right-of-way boundary line Liberty Road, right-of-way varies, same being the southern boundary line of said Block 5, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 249.50 feet to the southwest corner of said Block 5, at the intersection of the northern right-of-way boundary line of said Liberty Road, right-of-way varies, with the eastern right-of-way boundary line of 40 foot wide Clementine Street, for the southwest corner of the herein described 1.4501 acre tract;

THENCE North 2°36'42" West, coincident with the eastern right-of-way boundary line of 40 foot wide Clementine Street, same being the western boundary line of said Block 5, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 257.38 feet to the **POINT OF BEGINNING**, containing 1.4501 acres of land, more or less.

LESS & EXCEPT TRACT 5 – 1.3385 ACRE TRACT

BEING ALL THAT CERTAIN 1.3385 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being all of Block 4 as shown on the map of the Subdivision of Shares 2 & 3 of the Gagne Homestead, according to the map or plat thereof recorded in Volume 1, Page 55 of the Harris County Map Records, the herein described 1.3385 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the northeast corner of Block 5 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, said point being the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street with the eastern right-of-way boundary line of 40 foot wide Fontinot Street, said Point of Commencement being located at Texas State Plane coordinate position X=3136054.43 and Y=13852594.86;

THENCE North 87°19'08" East, crossing said 40 foot wide Fontinot Street, a distance of 39.68 feet to the northwest corner of said Block 4 of said Subdivision of Shares 2 & 3 of the Gagne Homestead, at the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street, with the western right-of-way boundary line of 40 foot wide Fontinot Street, for the northwest corner and the **POINT OF BEGINNING** herein described 1.3385 acre tract, at position X=3136094.07 and Y=13852596.71;

THENCE North 87°19'08" East, coincident with the southern right-of-way boundary line of said 50 foot wide Wylie Street, same being the northern boundary line of said Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 243.60 feet to the northeast corner of Lot 5 of said Block 4, at the intersection of the southern right-of-way boundary line of said 50 foot wide Wylie Street, with the western right-of-way boundary line of Erastus Street, right-of-way varies, for the northeast corner of the herein described 1.3385 acre tract

THENCE South 1°59'48" East, coincident with the western right-of-way boundary line of Erastus Street, right-of-way varies, same being the eastern boundary line of said Lot 5, Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 125.01 feet to an angle point;

THENCE South 87°19'08" West, coincident with the southern boundary line of said Lot 5, Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 7.04 feet to a point located in the northern boundary line of said Lot 6, Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, for an angle corner of the herein described 1.3385 acre tract,

THENCE South 1°59'48" East, coincident with the western right-of-way boundary line of Erastus Street, right-of-way varies, a distance of 115.29 feet to a point located on the northern right-of-way boundary line Liberty Road, right-of-way varies, same being the southern boundary line of said Lot 6, Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, for the southeast corner of the herein described 1.3385 acre tract;

THENCE South 85°26'51" West, coincident with the northern right-of-way boundary line Liberty Road, right-of-way varies, same being the southern boundary line of said Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 234.11 feet to the southwest corner of said Block 4, at the intersection of the northern right-of-way boundary line of said Liberty Road, right-of-way varies, with the eastern right-of-way boundary line of Fontinot Street, right-of-way varies, for the southwest corner of the herein described 1.3385 acre tract

THENCE North 2°36'42" West, coincident with the eastern right-of-way boundary line of 40 foot wide Fontinot Street, same being the western boundary line of said Block 4, of said Subdivision of Shares 2 & 3 of the Gagne Homestead, a distance of 247.93 feet to the **POINT OF BEGINNING**, containing 1.3385 acres of land, more or less.

11.6378 ACRE CITY OF HOUSTON OFFSITE PMZ TRACT
HARRIS AND WILSON 2 LEAGUE GRANT, ABSTRACT 32
HARRIS COUNTY, TEXAS

LESS & EXCEPT TRACT 6 – 1.0537 ACRE TRACT

BEING ALL THAT CERTAIN 1.0537 acre tract of land, lying and situated in the Wilson and Harris 2 League Grant, Abstract 32, Harris County Texas, being a portion of Block 9 as shown on the map of the Fair Ground Park Addition, according to the map or plat thereof recorded in Volume 81, Page 460 of the Harris County Deed Records, the herein described 1.0537 acre tract land hereby conveyed being more particularly described by metes and bounds, using survey terminology which refers to the Texas State Plane Coordinate System, South Central Zone (NAD83), in which the directions are Lambert grid bearings and the distances are surface level horizontal lengths (S.F.= 0.99989548017) as follows:

COMMENCING at the southwest corner of Block 10 of said Fair Ground Park Addition, said point being the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street with the eastern right-of-way boundary line of Erastus Street, right-of-way varies, said Point of Commencement being located at Texas State Plane coordinate position X=3136388.03 and Y=13852610.99;

THENCE South 2°09'23" East, crossing said 50 foot wide Wylie Street, a distance of 50.54 feet to the northwest corner of said Block 9 of said Fair Ground Park Addition, at the intersection of the southern right-of-way boundary line of 50 foot wide Wylie Street, with the western right-of-way boundary line of Erastus Street, right-of-way varies, for the northwest corner and the **POINT OF BEGINNING** herein described 1.0537 acre tract, at position X=3136390.09 and Y=13852561.66;

THENCE North 87°22'50" East, coincident with the southern boundary line of said 50 foot wide Wylie Street, same being the northern boundary line of said Block 9 of said Fair Ground Park Addition, a distance of 249.25 feet to the northeast corner of Lot 5 of said Block 9, at the intersection of the southern boundary line of said 50 foot wide Wylie Street, with the western boundary line of Cushing Street, right-of-way varies, for the northeast corner of the herein described 1.0537 acre tract

THENCE South 2°23'24" East, coincident with the western boundary line of Cushing Street, right-of-way varies, same being the eastern boundary line of said Lots 2 and 11, Block 9 of said Fair Ground Park Addition, a distance of 179.95 feet to a point located on the northern right-of-way boundary line Liberty Road, right-of-way varies, same being the southern boundary line of said Block 9 of said Fair Ground Park Addition, for the southeast corner of the herein described 1.0537 acre tract;

THENCE South 85°26'51" West, coincident with the northern right-of-way boundary line Liberty Road, right-of-way varies, same being the southern boundary line of said Block 9 of said Fair Ground Park Addition, a distance of 249.42 feet to the southwest corner of said Block 9, at the intersection of the northern right-of-way boundary line of said Liberty Road, right-of-way varies, with the eastern right-of-way boundary line of Erastus Street, right-of-way varies, for the southwest corner of the herein described 1.0537 acre tract

THENCE North 2°23'24" West, coincident with the eastern right-of-way boundary line of Erastus Street, right-of-way varies, same being the western boundary line of said Block 9 of said Fair Ground Park Addition, a distance of 188.36 feet to the **POINT OF BEGINNING**, containing 1.0537 acres of land, more or less.

EXHIBIT C

PLUME MANAGEMENT ZONE MAINTENANCE/MONITORING REQUIREMENTS

EXHIBIT "C"
MAINTENANCE AND MONITORING REQUIRMENTS

Union Pacific Railroad (UPRR), listed as the Responder under this Restrictive Covenant, will conduct regular sampling of monitoring wells located within the City of Houston Right-Of-Way and listed in the table below (Table C-1) for chemicals of concern (COCs) (see Table C-2) in accordance with the groundwater monitoring requirements established under the Texas Commission on Environmental Quality (TCEQ) Hazardous Waste Permit/Compliance Plan No. 50343. Monitoring and reporting activities are detailed in the Groundwater Sampling and Analysis Plan (SAP) and related compliance tables within the TCEQ Hazardous Waste Permit/Compliance Plan No. 50343.

Monitoring wells listed below will be inspected for signs of damage, including well pads, casing, locks, and, protective covers. Repairs will be made as necessary to ensure the integrity of the monitoring wells.

APPENDIX 6

SAMPLING PROCEDURES

See RCRA Permit Part B Compliance Plan Attachment XI.C for Sampling and Analysis Plan (SAP)

APPENDIX 7

STATISTICAL METHODOLOY

APPENDIX 7 – STATISTICAL OR GEOSTATISTICAL METHODOLOGIES

The statistical methodologies that will be employed at the Union Pacific Railroad (UPRR) Houston Wood Preserving Works (HWPW) Site include the following:

1. Calculating statistical trends for chemicals of concern (COCs) in groundwater to evaluate stability in COC concentrations; and
2. Calculating 95% upper confidence levels (UCLs) to demonstrate compliance with direct exposure criteria for soils.

Other statistical approaches may be used as appropriate for soil and groundwater data. The two approaches listed are discussed below.

Groundwater Trend Analysis

Trend analysis may be necessary to evaluate increasing trends when groundwater concentrations at the alternate points of exposure (POE) wells exceed the critical PCLs. Two approaches that may be conducted to evaluate statistical trends include the following:

- The Mann-Kendall Analysis; and
- Linear Regression Analysis

The selection of the statistical method will be assessed based on the data set. Typically, the Mann-Kendall test for trend is a nonparametric test that has no distributional assumptions and irregularly spaced measurement periods are permitted, where the Linear Regression is a parametric statistical procedure that is used for analyzing trends in data over time. However, other statistical approaches may also be used to evaluate trends. Details of the Mann-Kendall and linear regression analyses are provided below.

Mann-Kendall Analysis

General

The Mann-Kendall test is a non-parametric statistical procedure that is well suited for analyzing trends in data over time (Gilbert, 1987). The Mann-Kendall test can be viewed as a nonparametric test for zero slope of the first-order regression of time-ordered concentration data versus time. The Mann-Kendall test does not require any assumptions as to the statistical distribution of the data (e.g. normal, lognormal, etc.) and can be used with data sets which include irregular sampling intervals and missing data. The Mann-Kendall test is designed for analyzing a single groundwater constituent, multiple constituents are analyzed separately.

Mann-Kendall Statistic (S)

The Mann-Kendall statistic (S) measures the trend in the data. Positive values indicate an increase in constituent concentrations over time, whereas negative values indicate a decrease in constituent concentrations over time. The strength of the trend is proportional to the magnitude of the Mann-Kendall Statistic (i.e., larger magnitudes indicate a stronger trend).

Data for performing the Mann-Kendall Analysis should be in time sequential order. The first step is to determine the sign of the difference between consecutive sample results. $Sgn(x_j - x_k)$ is an indicator

function that results in the values 1, 0, or –1 according to the sign of $x_j - x_k$ where j > k, the function is calculated as follows

$\text{sgn}(x_j - x_k) = 1$ if $x_j - x_k > 0$
$\text{sgn}(x_j - x_k) = 0$ if $x_j - x_k = 0$
$\text{sgn}(x_j - x_k) = -1$ if $x_j - x_k < 0$

The Mann-Kendall statistic (S) is defined as the sum of the number of positive differences minus the number of negative differences or

$$S = \sum_{k=1}^{n-1} \sum_{j=k+1}^{n} \text{sgn}(x_j - x_k).$$

The confidence on the Mann-Kendall statistic can be measured by assessing the S result along with the number of samples, n, to find the confidence in the trend by utilizing a Kendall probability table found in many statistical textbooks (e.g. Hollander, M. and Wolfe, D.A., 1973). The resulting confidence in the trend is applied in the Mann Kendall trend analysis.

Average
The arithmetic mean of a sample of n values of a variable is the average of all the sample values written as

$$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$$

Standard Deviation
The standard deviation is the square root of the average of the square of the deviations from the sample mean written as

$$s = \sqrt{\frac{\sum_{i=1}^{n} (x_i - \bar{x})^2}{n-1}}.$$

The standard deviation is a measure of how the value fluctuates about the arithmetic mean of the data.

Coefficient of Variation (COV)
The Coefficient of Variation (COV) is a statistical measure of how the individual data points vary about the mean value. The coefficient of variation, defined as the standard deviation divided by the average or

$$C.O.V. = \frac{s}{\bar{x}}$$

Values less than or near 1.00 indicate that the data form a relatively close group about the mean value. Values larger than 1.00 indicate that the data show a greater degree of scatter about the mean.

Interpretation of Results: Mann-Kendall Analysis

- The COV is a statistical measure of how the individual data points vary about the mean value. Values less than or near 1.00 indicate that the data form a relatively close group about the mean

value. Values larger than 1.00 indicate that the data show a greater degree of scatter about the mean.

- The Mann-Kendall statistic (S) measures the trend in the data. Positive values indicate an increase in constituent concentrations over time, whereas negative values indicate a decrease in constituent concentrations over time. The strength of the trend is proportional to the magnitude of the Mann-Kendall Statistic (i.e., larger magnitudes indicate a stronger trend).

- The "Confidence in Trend" is the statistical confidence that the constituent concentration is increasing (S>0) or decreasing (S<0).

- The "Concentration Trend" for each well is determined according to the following rules, where COV is the coefficient of variation:

MANN-KENDALL ANALYSIS DECISION MATRIX

Mann-Kendall Statistic	Confidence in Trend	Concentration Trend
S > 0	> 95%	Increasing
S > 0	90 - 95%	Probably Increasing
S > 0	< 90%	No Trend
S ≤ 0	< 90% and COV ≥ 1	No Trend
S ≤ 0	< 90% and COV < 1	Stable
S < 0	90 - 95%	Probably Decreasing
S < 0	95%	Decreasing

Linear Regression Analysis

General

As discussed in the EPA Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities – Unified Guidance (EPA, 2009), a common method to measure a linear trend is to compute a linear regression of concentration data when plotted against the time or date of sample collection. Each point along a linear regression trend line is an estimate of the true mean concentration at that point in time. Therefore, a linear regression can be used to assess whether or not the population mean at an alternate point of exposure (POE) well has significantly increased or decreased.

Linear regression is valid if the data set is parametric. Other assumptions for using the statistical technique is that the difference between each concentration measurement and its predicted value from the regression equation are approximately normal in distribution and homoscedastic (*i.e.*, equal in variance at different times and for different mean concentration levels). Significant skewness or the presence of outliers can invalidate the trend analysis based on linear regression. Also, standard linear regression methods do not account for non-detects or missing data values at selected sampling events. Therefore, linear regression is best used for data sets that have few if any non-detects (EPA, 2009).

A minimum of 8 to 10 measurements is generally necessary to compute a linear regression. The regression residuals should be statistically independent and the analysis should be based on reliably quantified measurements. If not, a calculated "trend" may be an artifact induced by changes in quantitation limits over time. Such artifacts of plotting and data reporting should not be considered real trends.

The procedures for calculating the linear regression are taken from the EPA Unified Guidance (EPA, 2009):

Step 1. Construct a time series plot of the compliance point measurements. If a discernible trend is evident, compute a linear regression of concentration against sampling date (time), letting x_i denote the *i*th concentration value and *t*i denote the *i*th sampling date. Estimate the linear slope $\hat{b}$ with the formula:

$$\hat{b} = \sum_{i=1}^{n} \frac{(t_i - \bar{t})x_i}{n-1} \times s_i^2$$

This estimate then leads to the regression equation, given by:

$$\hat{x_i} = \bar{x} + \hat{b}\,(t - \bar{t}\,)$$

where $\bar{t}$ denotes the mean sampling date, s_t^2 is the variance of sampling dates, $\bar{x}$ is the mean concentration level, and $\hat{x_i}$ represents the estimated mean concentration at time *t*.

Note: though the variable *t* above represents time, it could just as easily signify another variable, perhaps a second constituent for which an association with *x* is estimated.

Step 2. Compute the regression residual at each sampling event *i* with equation:

$$r_i = x_i - \hat{x_i}$$

Check the set of residuals for lack of normality and significant. Also, plot the residuals against the estimated regression values ($\hat{x_i}$) to check for non-uniform vertical thickness in the scatter cloud. Make a similar check by plotting the residuals against the sampling dates (t_i).

If the residuals are non-normal and substantially skewed and/or the scatter clouds appear to have a definite pattern (*e.g.*, funnel-shaped; "U"-shaped; or, residuals mostly positive on one end of graph and mostly negative on the other end, instead of randomly scattered around the horizontal line $r = 0$), repeat **Steps 1** and **2** after first attempting a normalizing transformation.

Step 3. Calculate the estimated variance around the regression line (also known as the *mean squared error* [MSE]) with the following equation:

$$s_e^2 = \frac{1}{n-2} \sum_{i=1}^{n} r_i^2$$

Step 4. Compute the standard error of the linear regression slope coefficient using the s_e^2 result from Step 3.

$$se(\hat{b}) = \sqrt{s_e^2 / \sum_{i=1}^{n} (t - \bar{t})^2}$$

Step 5. Test whether the trend is significantly different from zero by forming the *t*-statistic ratio in the following equation:

$$t_b = \hat{b} / se(\hat{b})$$

This *t*-statistic (t_b) has *n*–2 degrees of freedom [*df*]. Given a level of significance (α), choose the critical point (t_{cp}) for the test as the (1– α) × 100th percentage point of the Student's *t*-distribution with (*n*–2) *df* or $t_{cp} = t_{1-\alpha,n-2}$. Compare t_b against the critical point. If $t_b > t_{cp}$, conclude that the slope of the trend is both positive and significantly different from zero at the α-level of significance. If $t_b < -t_{cp}$, conclude there is a significant decreasing trend. If neither exists, there is insufficient evidence of an increasing or decreasing trend.

Both of these calculations can be conducted using various computer statistical software. One approach is to use the Monitoring and Remediation Optimization System (MAROS) Software (AFCEE, 2006) or U.S. Environmental Protection Agency (EPA) ProUCL software program (EPA, 2013).

Statistical Determination of 95% Upper Confidence Limit (UCL) for COC Concentrations in Soils

In accordance with 30 TAC§350.79(2)(A), the statistical test may be performed to determine if COCs in soils at the Site exceeded the critical PCL ($^{Tot}SOIL_{Comb}$) established during the critical PCL development process. 30 TAC§350.79(2)(A) states that the requirement of a response action may be determined by using an appropriate statistical method. The statistical method identified in the TRRP rule is as follows:

(i) The null hypothesis (H_o) is that the mean of the COC concentrations in the affected property is equal to or greater than the critical PCL;
(ii) The alternative hypothesis (H_a) is that the mean COC concentration is less than the critical PCL;
(iii) The test is performed at a Type I error rate of 5%; and
(iv) Any statistical model used for testing this hypothesis set must be demonstrated to meet these performance standards.

An analysis may be performed to determine the mean concentration in soils with a Type I error rate of 5%. This analysis can be performed using the EPA's ProUCL software program (EPA, 2013) to calculate a distribution-free (i.e., nonparametric) 95% upper confidence limit (UCL) concentration from a selected data set, including non-detect concentration values (i.e., represented by the sample quantitation limit). ProUCL calculates various types of the 95% UCLs, and then makes a recommendation for the most appropriate UCL type.

Mann Kendall Trend Analysis

MEMORANDUM

DATE August 7, 2020 **Project No.** 19119232

TO Eric Matzner
Golder Associates Inc.

CC Michelle Hermiston

FROM Teresa Shaw

RE: TREND ANALYSIS, UNION PACIFIC RAILROAD, HOUSTON WOOD PRESERVING WORKS SITE

Long-term trends of concentrations of the most common chemicals of concern (COCs) at currently existing monitoring wells in each groundwater bearing unit (GWBU) from January 2009 (or well installation date) to January 2020 at the Union Pacific Railroad (UPRR) Houston Wood Preserving Work Site (the Site) were evaluated by performing Mann-Kendall trend tests. The Mann-Kendall is a nonparametric method (i.e., does not need a distributional assumption of the data) to test for an increasing or decreasing linear trend over time. The Mann-Kendall does not require any special treatment for non-detects, other than all non-detects should be set to a common value lower than any of the detections (EPA, 2009 p.8-32). The Mann-Kendall was performed for any COC and well with at least one detection. Any COC and well with all non-detects (all concentrations below detection limits) during all sampling events was indicated with an "ND" on Table 1. Monitoring wells with fewer than three sampling events were not analyzed.

Mann-Kendall test results with a p-value less than an error rate of α=0.05 (i.e., 95% level of confidence) indicate a statistically significant increasing or decreasing trend. Results with a p-value greater than 0.05 but less than 0.1 indicate a "probably" increasing or "probably" decreasing trend. Mann-Kendall test results with a p-value greater than 0.10 indicate either a "stable" trend or "no trend". A "stable" trend occurred when data from a COC and well had a coefficient of variation less than 1, appeared to follow a decreasing trend (when the Mann-Kendall test statistic was negative), and had a p-value from the Mann-Kendall test greater than 0.10. In all other cases when the p-value from the Mann-Kendall test was greater than 0.10, the COC and well was considered to have "no trend".

For each COC and well, time plots were generated (see Attachment A), and the Mann-Kendall trend tests were performed using the statistical software R© (The R© Foundation, 2020) and the EnvStats package (Package 'EnvStats', 2020).

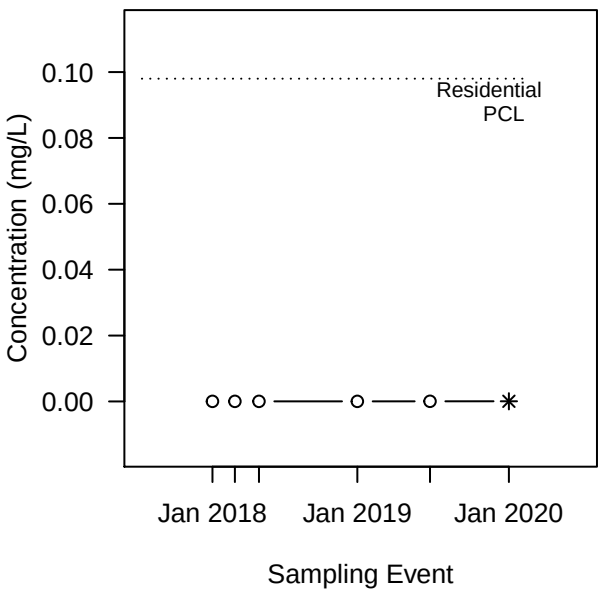
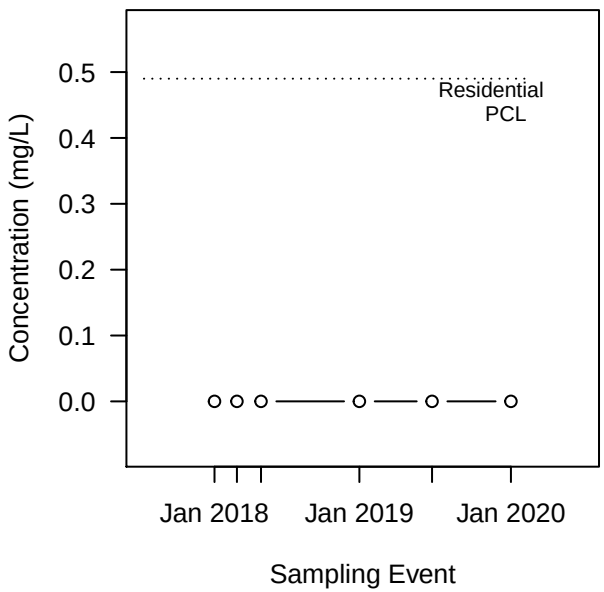
Mann−Kendall Trend Tests for MW−03

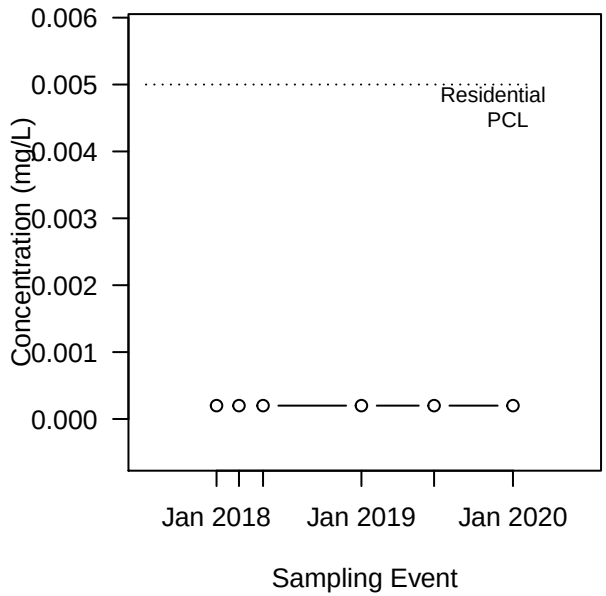
2−Methylnaphthalene (Det/N = 1/6)
No Trend
(p−value=0.121 and CV=0.43)



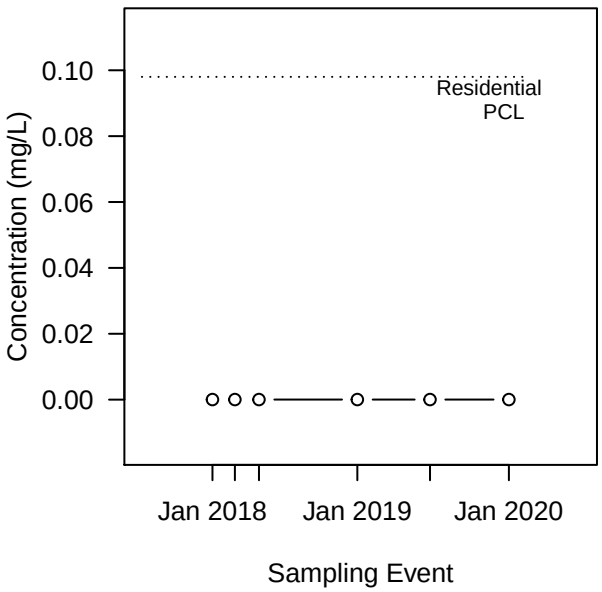
2,4−Dimethylphenol (Det/N = 0/6)
Not evaluated (all concentrations are identical)



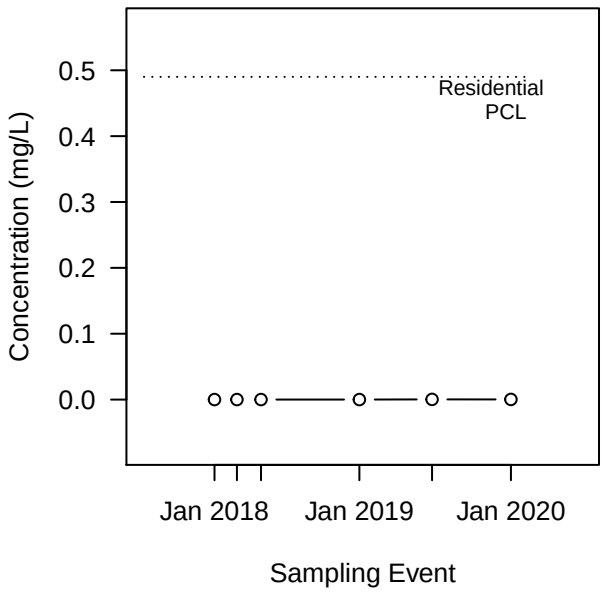
Benzene (Det/N = 0/6)
Not evaluated (all concentrations are identical)



Dibenzofuran (Det/N = 0/6)
Not evaluated (all concentrations are identical)



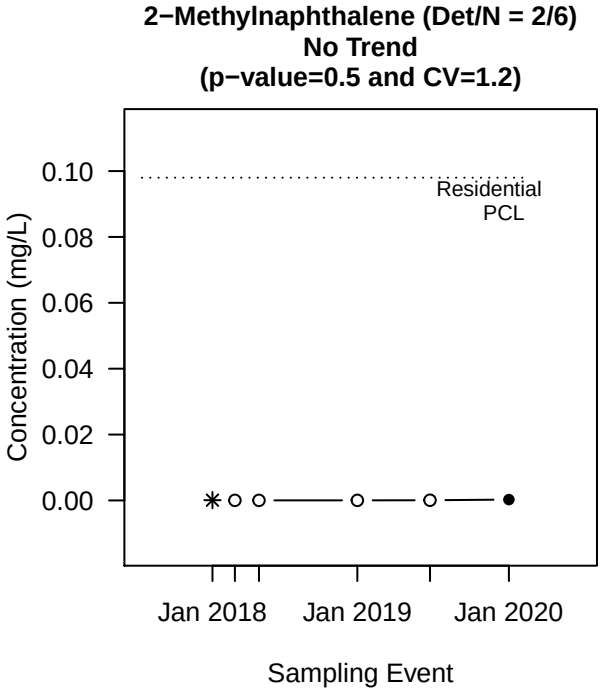
Naphthalene (Det/N = 0/6)
Not evaluated − All NDs

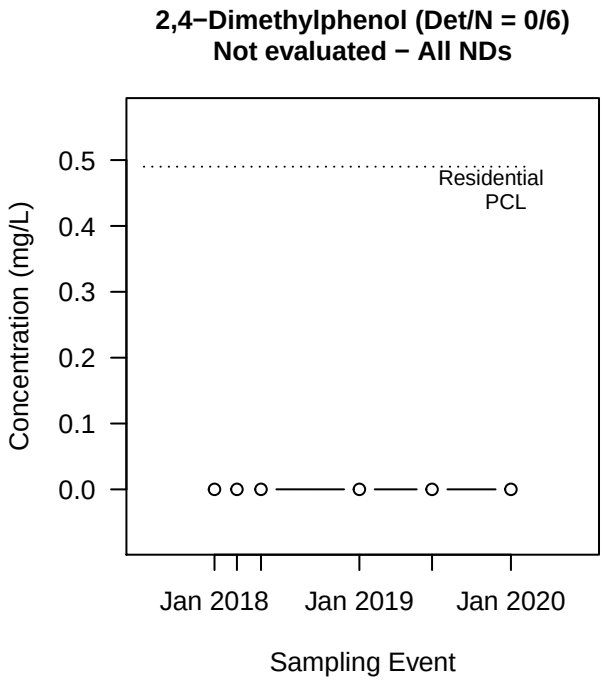


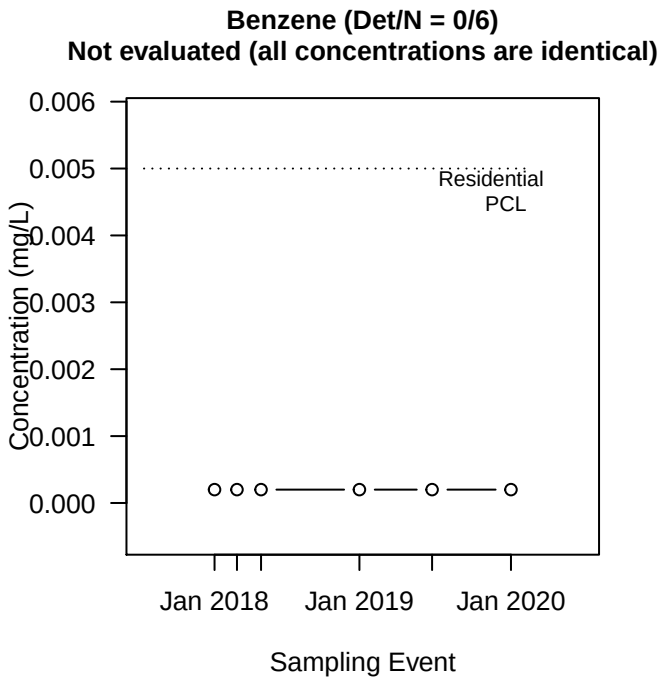
LEGEND:
Concentration
- DET
- DET, J−flagged
- ND (DL plotted)

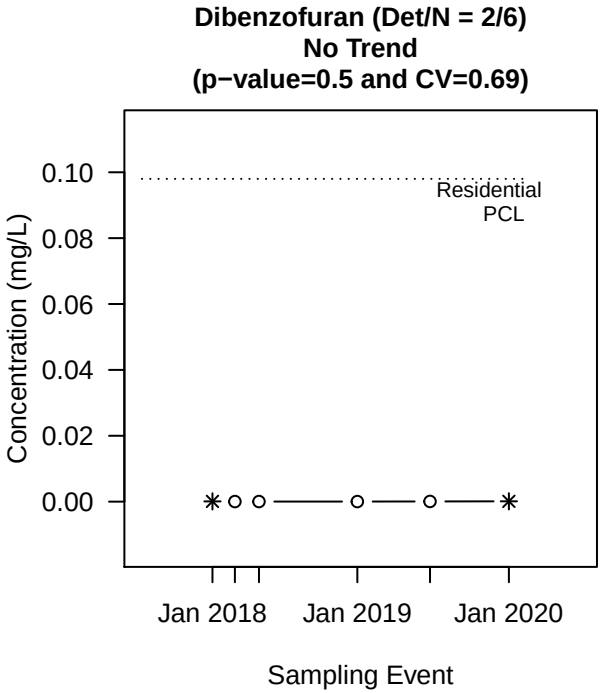
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

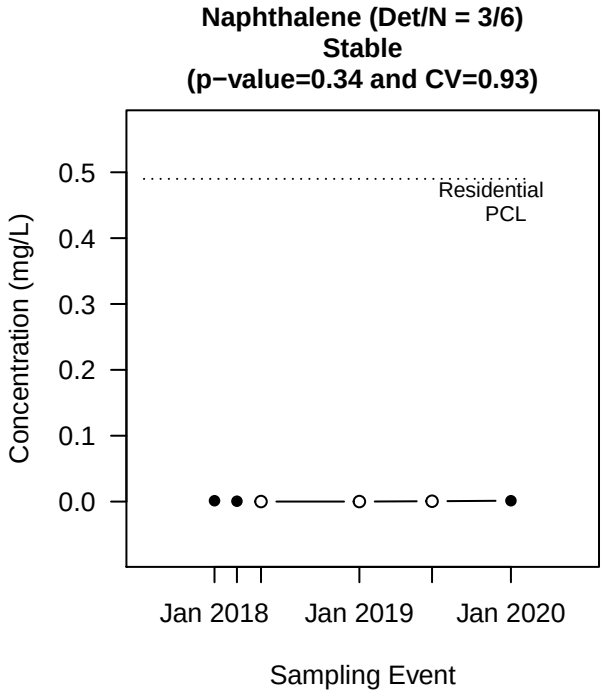
Mann−Kendall Trend Tests for MW−04

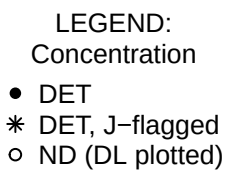








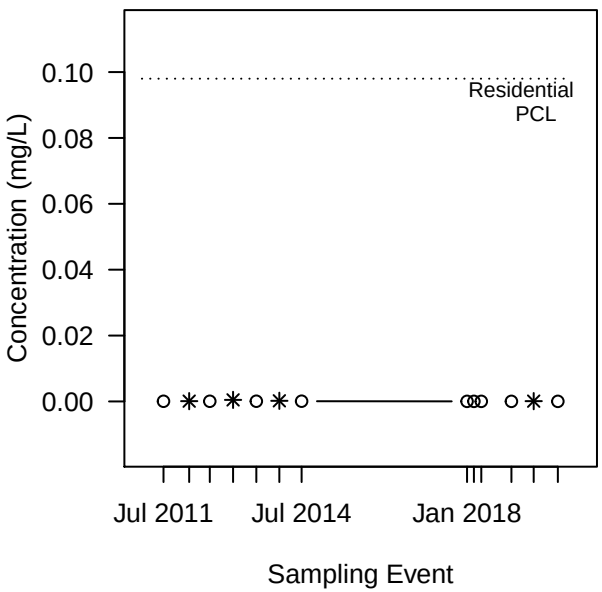




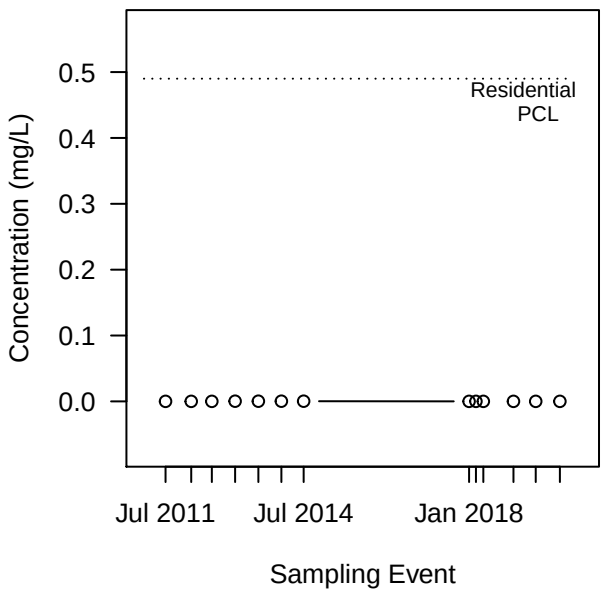
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

Mann−Kendall Trend Tests for MW−05

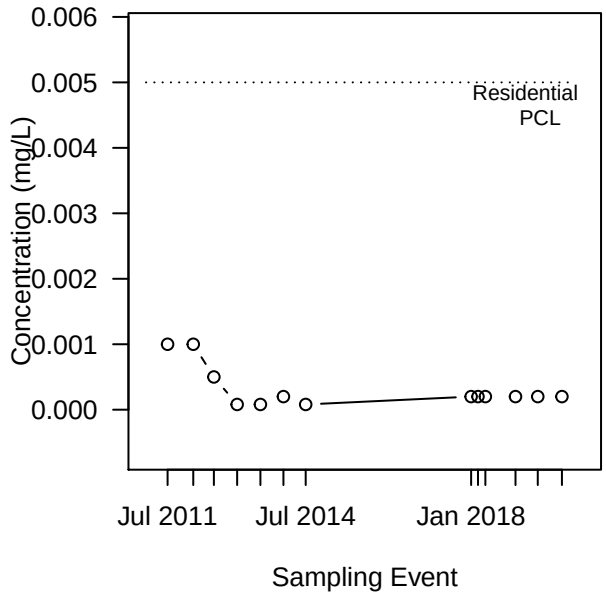
2−Methylnaphthalene (Det/N = 4/13)
No Trend
(p−value=0.299 and CV=1.4)



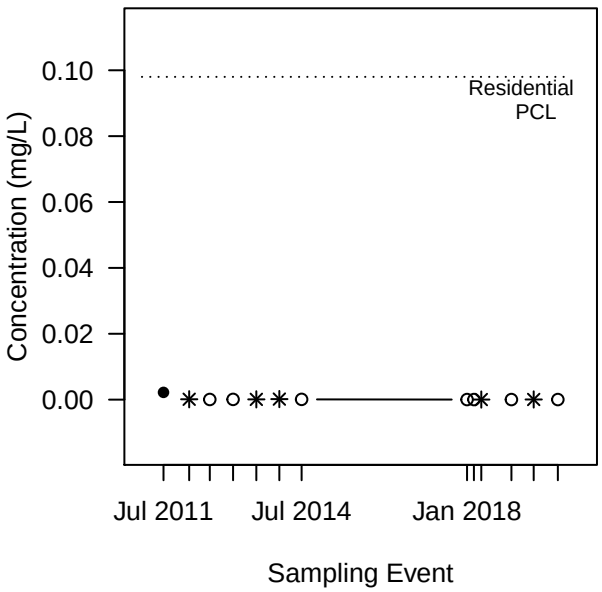
2,4−Dimethylphenol (Det/N = 0/13)
Not evaluated − All NDs



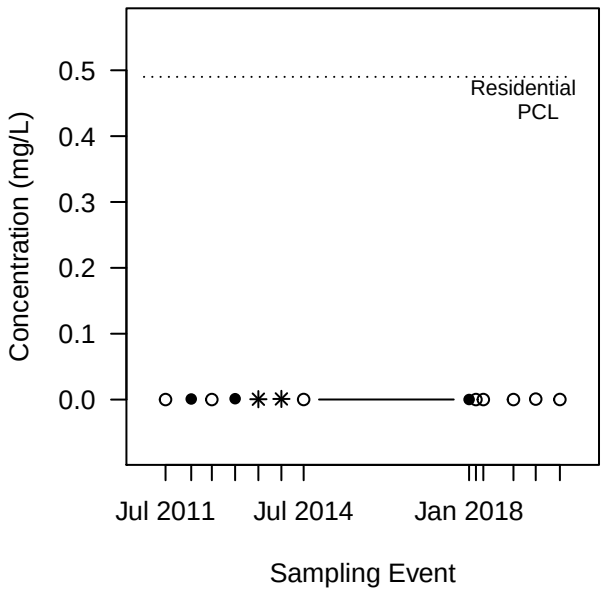
Benzene (Det/N = 0/13)
Not evaluated − All NDs



Dibenzofuran (Det/N = 6/13)
Probably Decreasing
(p−value=0.0909 and CV=2.7)



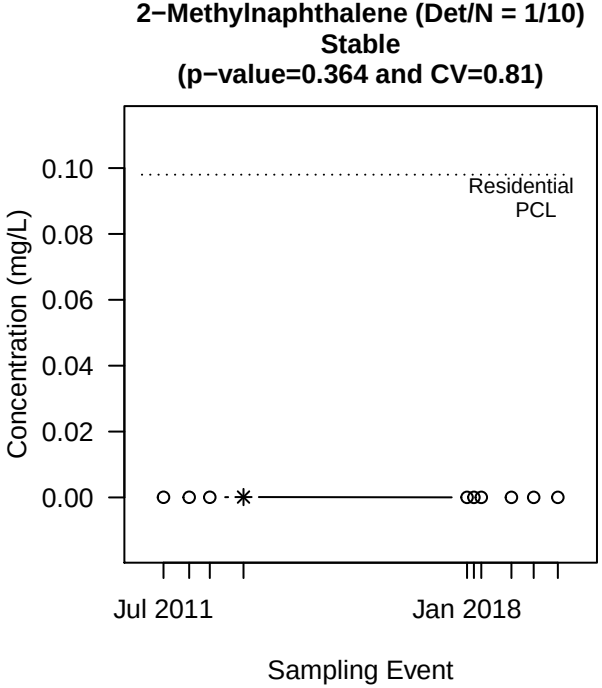
Naphthalene (Det/N = 5/13)
Probably Decreasing
(p−value=0.0534 and CV=1.2)

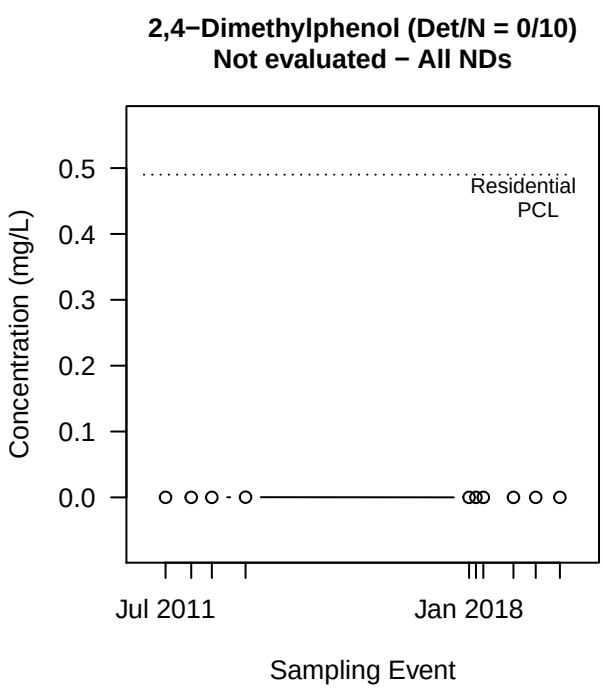


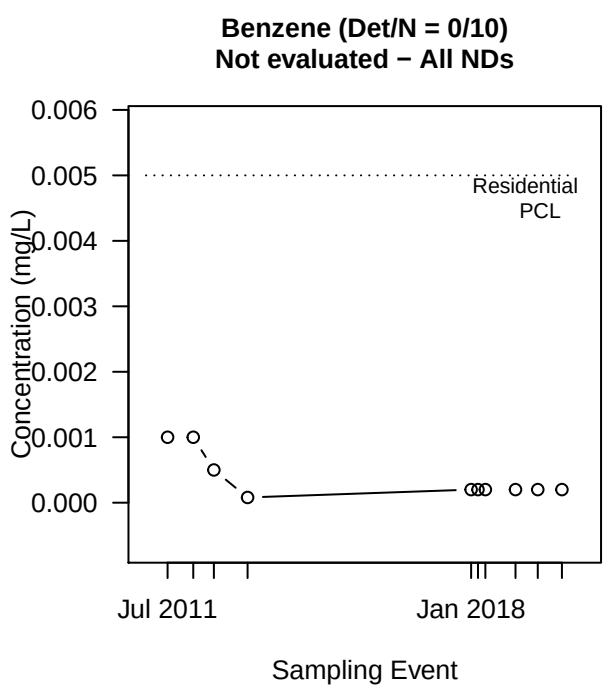
LEGEND:
Concentration
- DET
- DET, J−flagged
- ND (DL plotted)

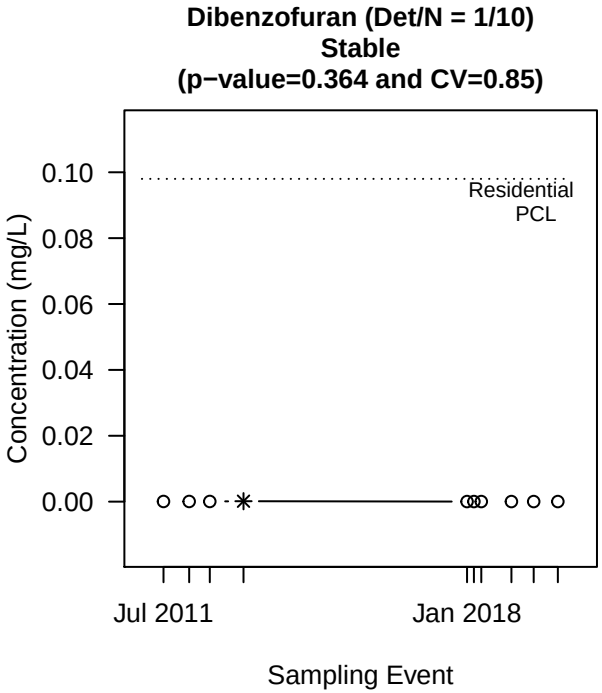
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

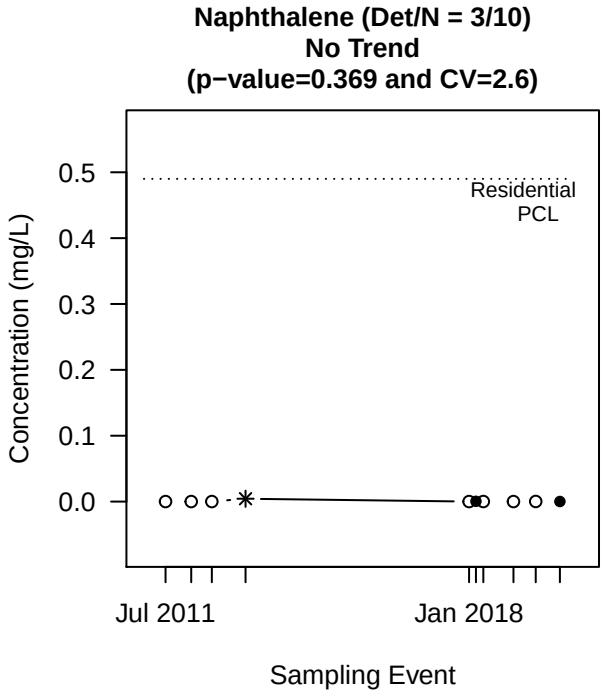
Mann−Kendall Trend Tests for MW−09

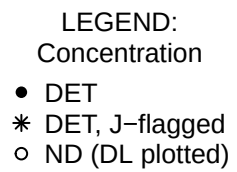






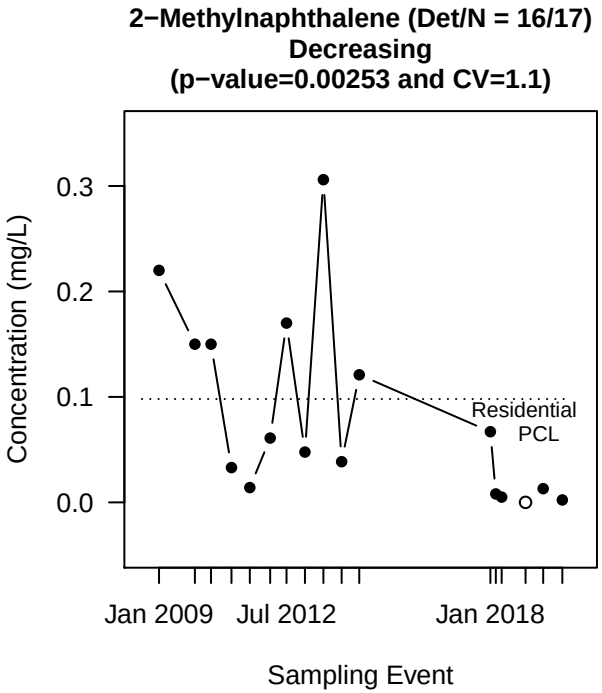


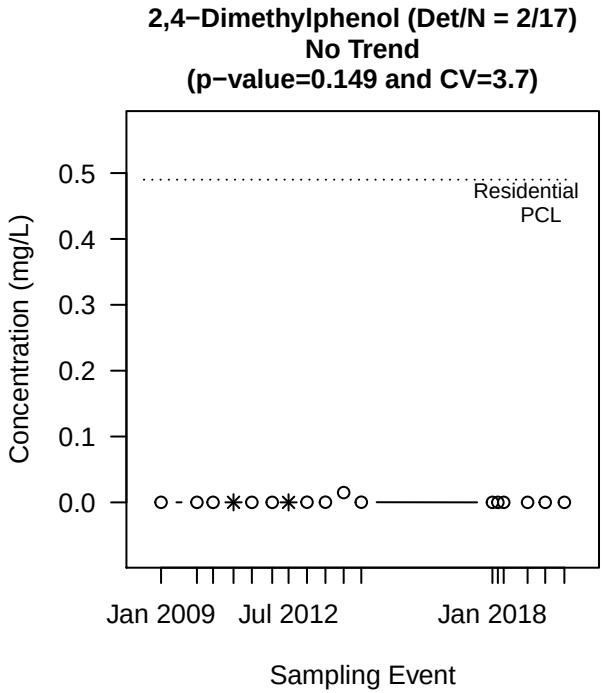


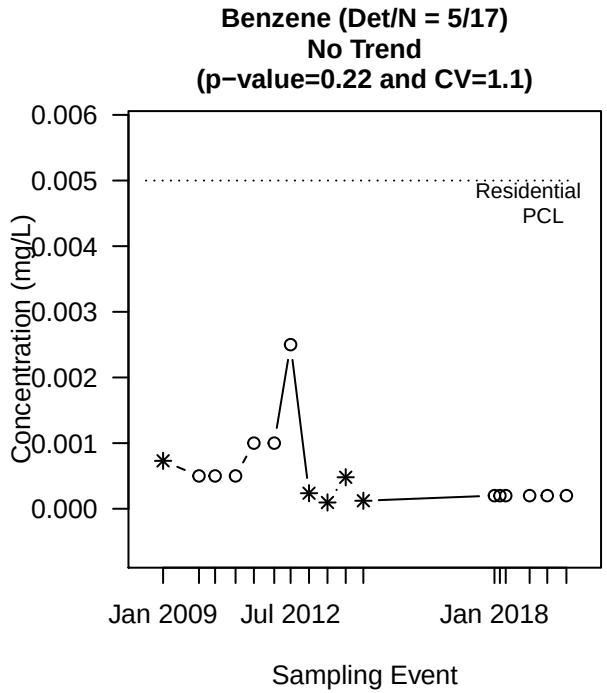


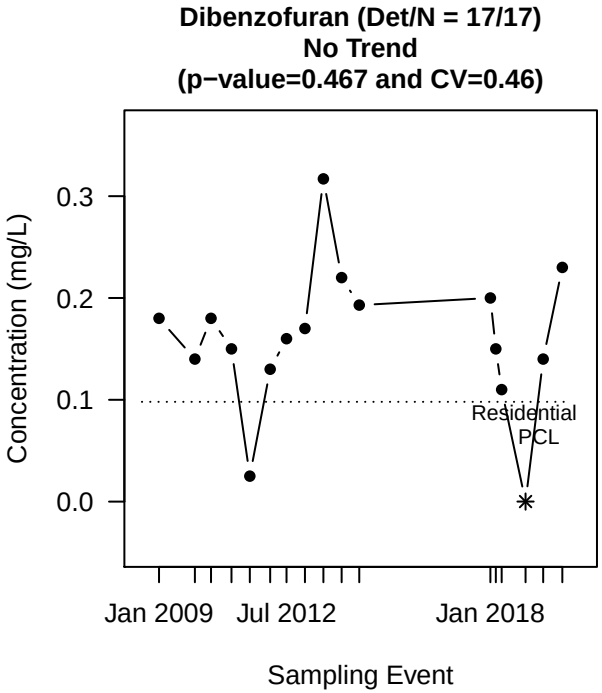
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

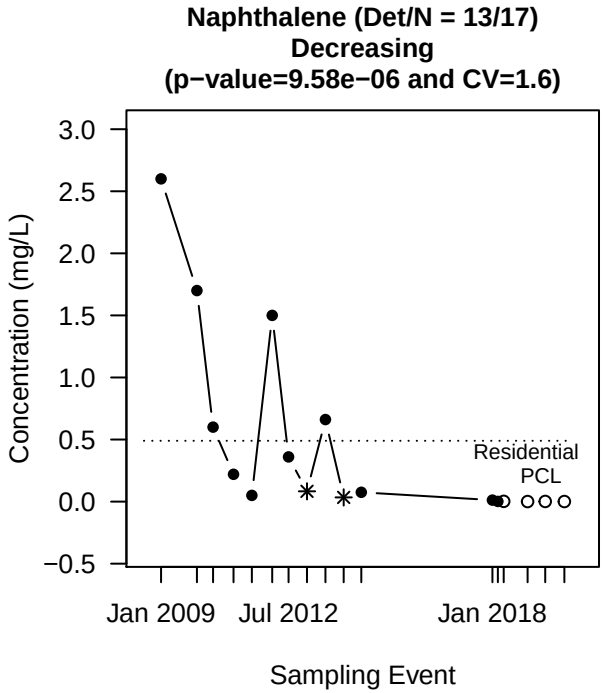
Mann−Kendall Trend Tests for MW−12A

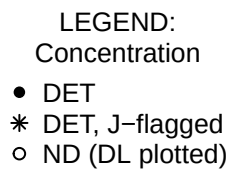








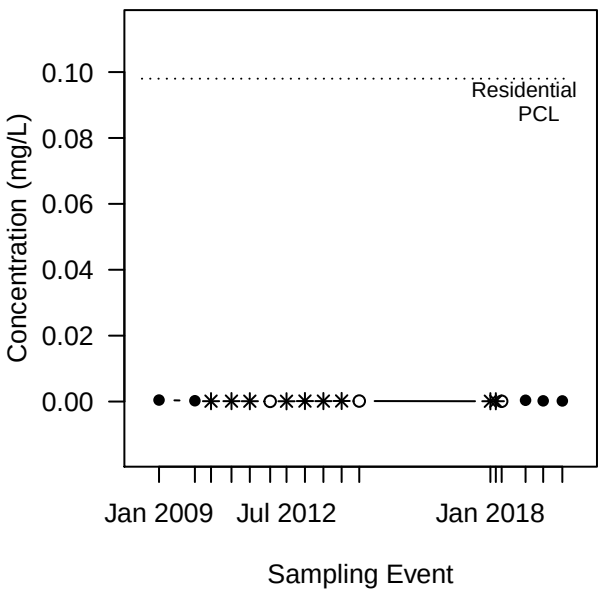




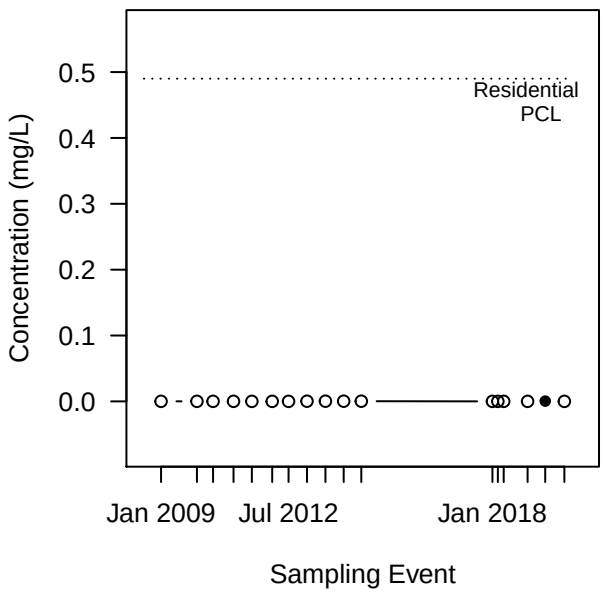
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

Mann−Kendall Trend Tests for MW−12C

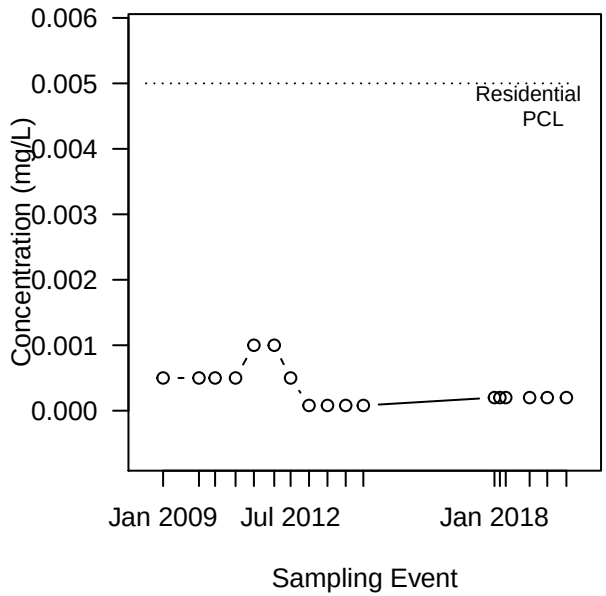
2−Methylnaphthalene (Det/N = 14/17)
Stable
(p−value=0.402 and CV=0.66)



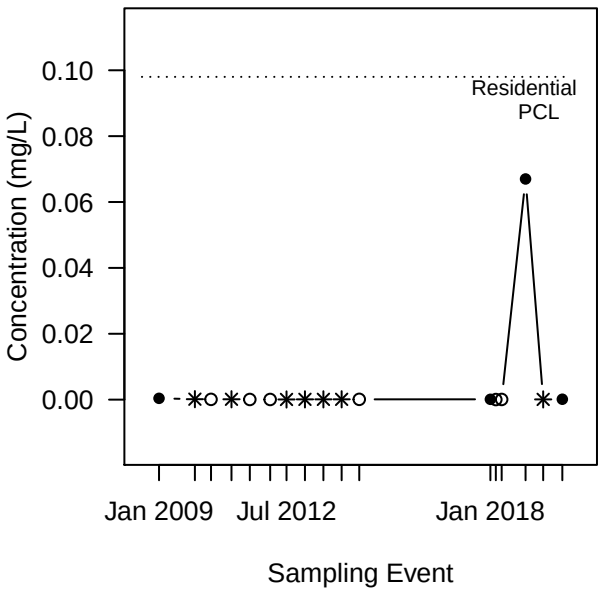
2,4−Dimethylphenol (Det/N = 1/17)
Probably Increasing
(p−value=0.0923 and CV=0.97)



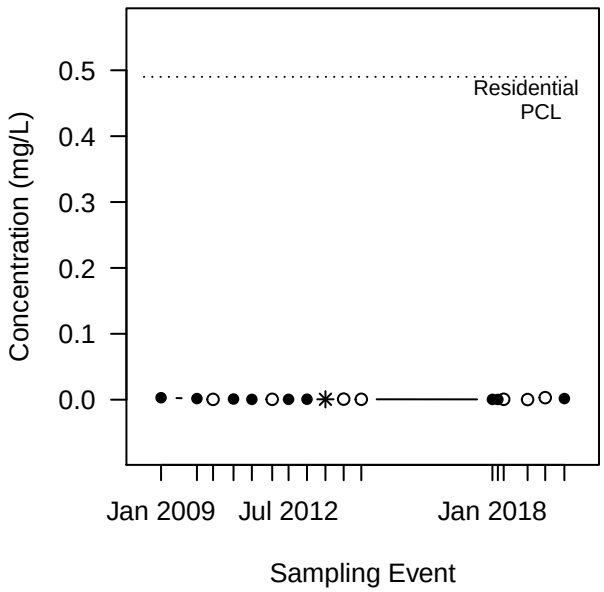
Benzene (Det/N = 0/17)
Not evaluated − All NDs



Dibenzofuran (Det/N = 11/17)
No Trend
(p−value=0.5 and CV=4)



Naphthalene (Det/N = 10/17)
Decreasing
(p−value=0.0326 and CV=0.89)

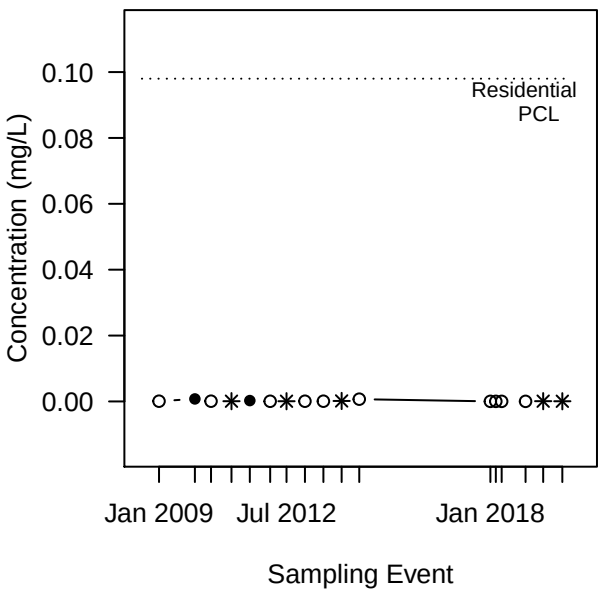


LEGEND:
Concentration
- DET
- DET, J−flagged
- ND (DL plotted)

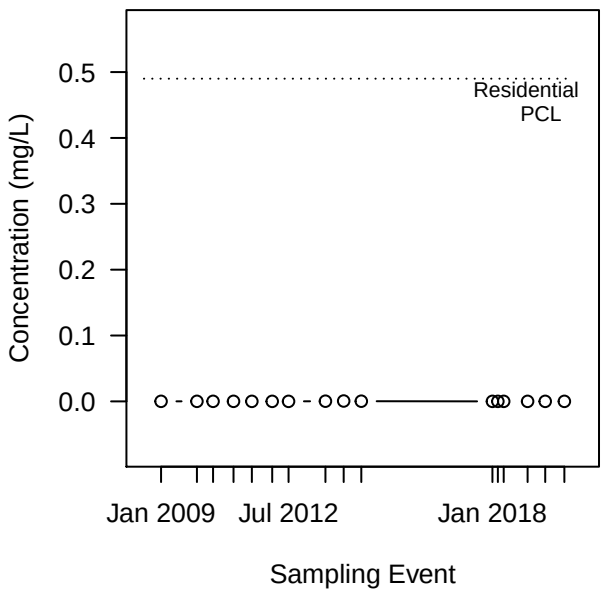
NOTE: A p−value<0.05 indicates a statistically significant trend.
A p−value is the probability, if no trend is present, that we'd observe such an increasing or decreasing trend.

Mann−Kendall Trend Tests for MW−13

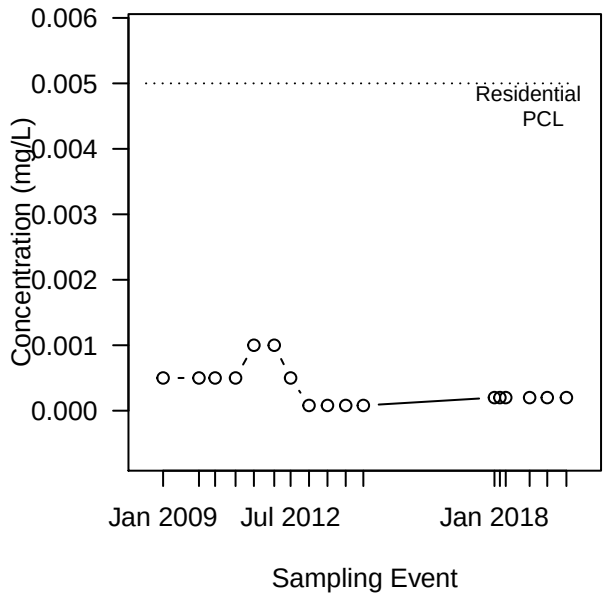
2−Methylnaphthalene (Det/N = 7/17)
No Trend
(p−value=0.258 and CV=1.5)



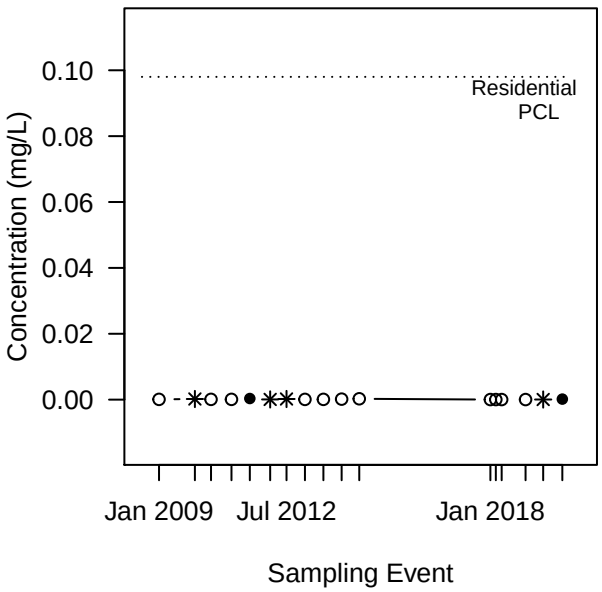
2,4−Dimethylphenol (Det/N = 0/16)
Not evaluated − All NDs



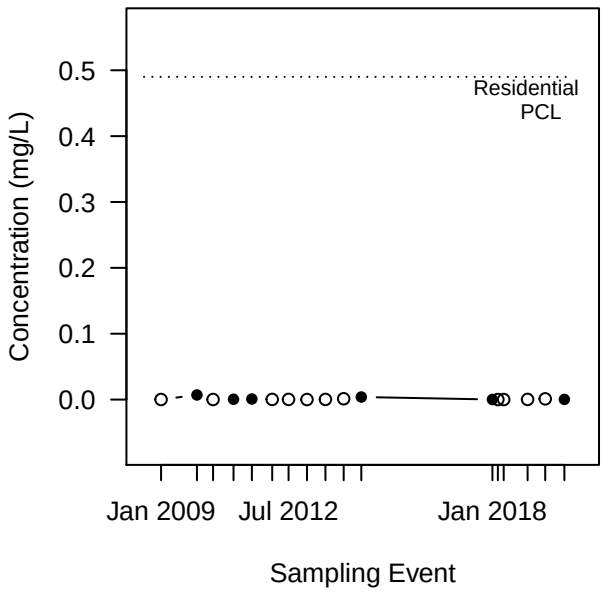
Benzene (Det/N = 0/17)
Not evaluated − All NDs



Dibenzofuran (Det/N = 6/17)
Stable
(p−value=0.367 and CV=0.84)



Naphthalene (Det/N = 6/17)
No Trend
(p−value=0.28 and CV=1.9)



LEGEND:

Remedy Standard A

___ Self-Implementation Notice Submittal date: _____

___ Response Action Plan - Approval date: _____

Remedy Standard B

X Response Action Plan - Approval date: Currently under review. Corrective action approved under the TCEQ Area of Contamination (AOC) Approval dated February 9, 2015 (and amended February 22, 2016).

List all media (surface soil, subsurface soil, groundwater, sediment, surface water, air) that contained or contains a PCLE zone and specify the response action taken for each media. Indicate the type of removal, decontamination, physical control, or institutional control action that was used in the response action. If a media with a PCLE zone was not addressed in the response action, provide an explanation below.

Media	COCs[1]	Removal	Decontamination	Physical Control	Institutional Control	Modified Response Objective[2]		
						PMZ	WCU	TI
Surface Soil	Benzene, SVOCs, metals	X		X	X			
Subsurface Soil	SVOCs			X	X			

Is there a media that contains a PCLE zone that was not addressed in the response action? **X** yes ___ no

If yes, provide justification for not addressing the PCLE zone in the response action.

This Response Action Completion Report (RACR) only addresses the response actions for the surface and subsurface soil PCLE Zones. The response action for the groundwater PCLE zone is detailed in the Response Action Plan (RAP) dated November 21, 2014, and revised dated December 7, 2015, July 15, 2016, June 24, 2017, July 10, 2019, and August 31, 2020. Following approval of the RAP by the TCEQ and implementation of the proposed response action, a separate RACR will be submitted to the TCEQ for the groundwater PCLE zone.

Current land use of the on-site affected property: ___ Residential **X** Commercial/industrial

Projected future land use of the on-site property (if known): ___ Residential **X** Commercial/industrial

Explain why you believe the response action to be complete.

As discussed in the RAP (PBW, 2015), the response action objectives (RAOs) for surface and subsurface soil PCLE Zones was to excavate impacted soils with COCs above cPCLs and consolidate the soils within the Site using the Area of Contamination approach, and control exposure through Remedy Standard B using physical barriers such that on-site commercial/industrial and off-site residential pathways will not be

[1] Specify either a specific COC or, if the response action is the same for all COCs in one type, specify the type of COC (for example, VOCs, SVOCs, metals).

[2] If a modified groundwater response objective was used, check the type(s) of modifications.

excavation of the top 9-inches (consolidated within the on-site soil-capped area) and construction of a physical barrier (concrete sidewalk) preventing contact with remaining surface soils and limiting infiltration. After the soils were excavated, UPRR constructed a concrete sidewalk approximately 8 feet wide and 690 feet long serving as the physical barrier covering the remaining surface soil PCLE zone within the City of Houston ROW. As part of the post-response action care detailed in the RAP (PBW, 2015), the concrete sidewalk will be inspected to ensure the physical barrier provides protection for residential receptors against exposure to the COCs above cPCLs in surface soils in this area.

- Englewood Intermodal Yard area: The surface soil PCLE zone in the Intermodal Yard area is currently covered with a physical barrier (concrete pavement), preventing contact with the soil PCLE Zone and infiltration. As part of the post-response action care, the concrete pavement in the area of the surface soil PCLE Zone will be inspected to ensure continued on-site worker protection.

- UPRR Main Lines Ballast Area: The area between the former HWPW operational areas and the Englewood Intermodal Yard (approximately 100 feet width) is covered with railroad ballast, ties, and rail. UPRR will use the existing railroad ballast as an engineering control for preventing on-site worker exposure to impacted surface soils in this area.

The physical controls at the Site will be maintained and appropriate maintenance, repair of the caps will be performed as needed. UPRR will implement a health and safety program to restrict any construction activity within the capped areas. In the event construction activities are necessary, a health and safety plan and soil management plan will be implemented to ensure worker protection and proper management of soils with COCs above cPCLs.

Checklist for Report Completeness

Use this checklist to determine the portions of the form that must be submitted for this report. Answer all questions by checking Yes or No. If the answer is Yes include that portion of the report. If the answer is No, do not complete or submit that portion of the report. All form contents that are marked "Required" must be submitted. Form contents marked with an asterisk (*) are not included in the blank form and are to be provided by the person.

			Report Contents	
		Required	**Cover Page**	☒
