DATA REVIEW

Philadelphia, Pennsylvania

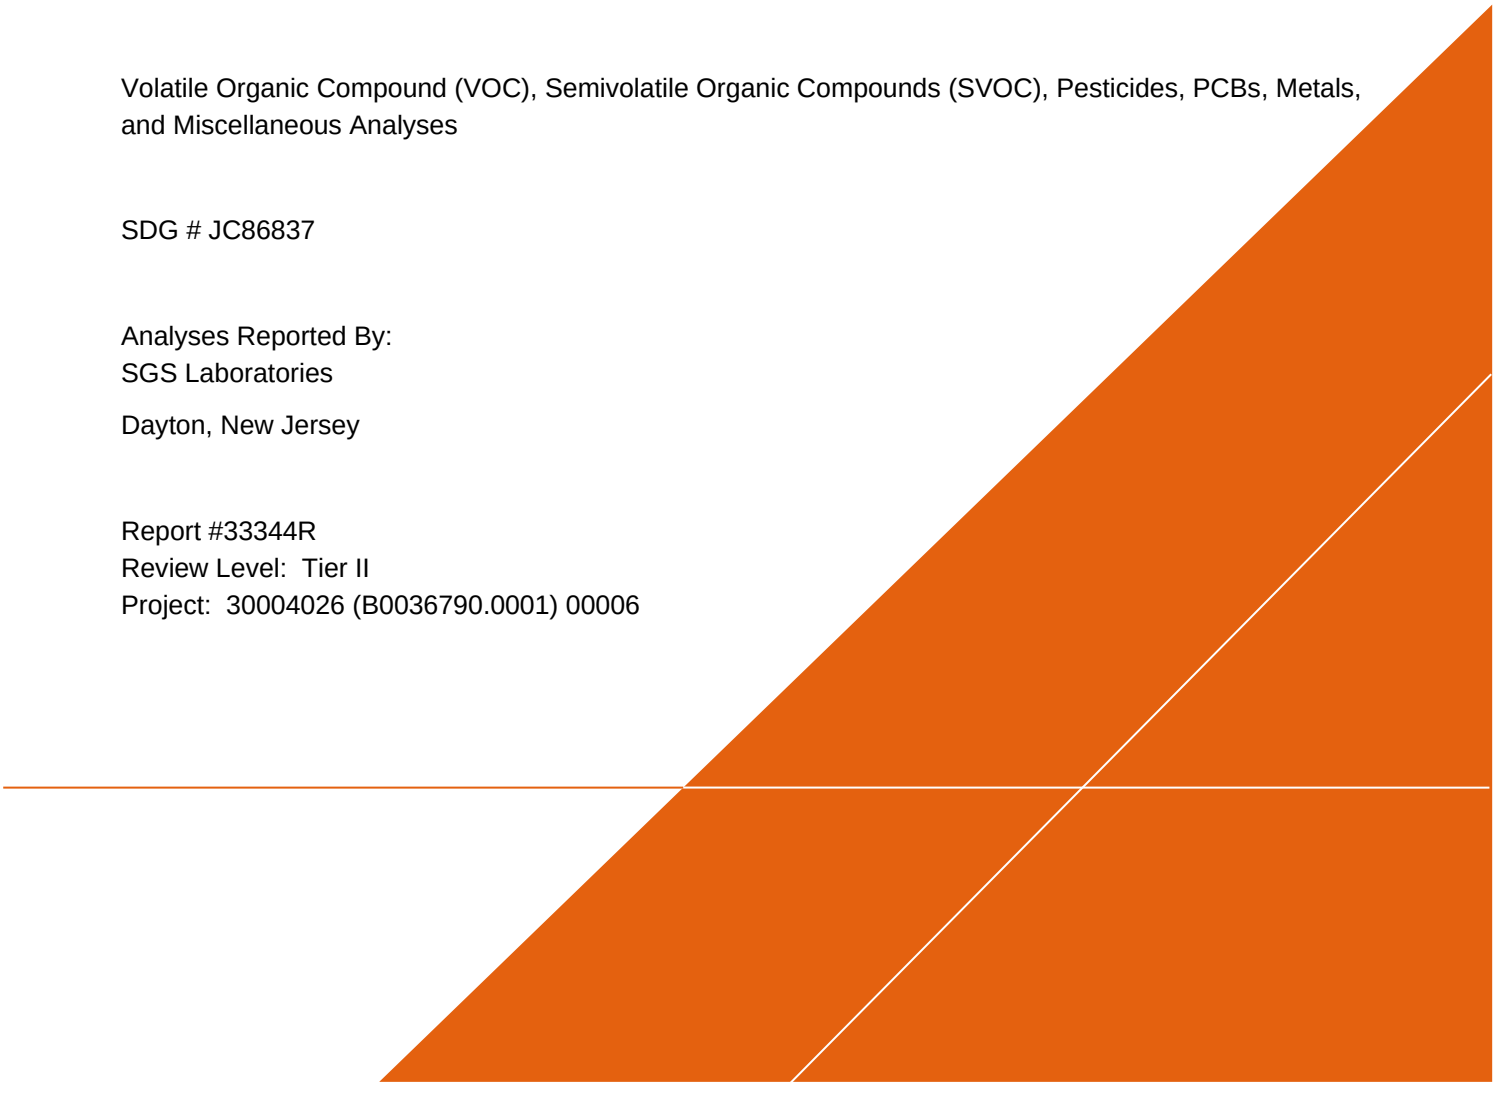
Volatile Organic Compound (VOC), Semivolatile Organic Compounds (SVOC), Pesticides, PCBs, Metals, and Miscellaneous Analyses

SDG # JC86837

Analyses Reported By:
SGS Laboratories

Dayton, New Jersey

Report #33344R
Review Level: Tier II
Project: 30004026 (B0036790.0001) 00006



SUMMARY

This data review report summarizes the review of Sample Delivery Group (SDG) # JC86837 for samples collected in association with the National Grid Philly Coke site in Philadelphia, Pennsylvania. The review was conducted as a Tier II evaluation and included review of laboratory analytical data package completeness. Field documentation was not included in this review. Included with this assessment are the post-validation annotated sample result sheets, and chain of custody (COC). Analyses were performed on the following samples

SDG Number	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PEST/ PCB	Metals	MISC
JC86837	PSCB-41R(0.5-2) (04-22-2019)	JC86837-1	Soil	4/22/2019		X	X	X	X	X

	S-107(2-4) (04-23-2019)	JC86837-12	Soil	4/23/2019		X	X		X	X

Notes:

1. PEST/PCB = Pesticides and polychlorinated biphenyls
2. SVOC = Semivolatile Organic Compounds
3. VOC = Volatile Organic Compound
4. MISC = Miscellaneous (total cyanide)

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of Quality Assurance (QA) or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8260C, 8270D, 8081A, and 8082A. Data were reviewed in accordance with the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Superfund Methods Data Review, EPA 540/R-2017-002, January 2017 and the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, EPA540/R-99/008, October 1999 (as applicable).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times/Preservation

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD was not performed on a sample within this SDG.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

7. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

8. System Performance and Overall Assessment

The laboratory narrative indicates continuing calibration deviations. These deviations are normally not evaluated in a tier II data review. Sample results that had continuing calibration recoveries that exceed the control limit high and were non detect did not require qualification. Sample results where the calibration recoveries were high and the compound was detected or calibration recoveries were low were qualified as estimated (J or UJ).

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SEMIVOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
S-136(4-6) (04-22-2019) S-136(7-9) (04-22-2019) S-111(2-4) (04-23-2019) S-111(4.5-6.5) (04-23-2019) S-107(2-4) (04-23-2019)	3&4-Methylphenol Acetophenone Hexachloroethane N-Nitroso-di-n-propylamine

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

7. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

Several samples were diluted to bring target compounds within linear range of the instrument. Sample results that were reported from a secondary dilution were qualified with a “D”, indicating the result is diluted.

8. System Performance and Overall Assessment

The laboratory narrative indicates continuing calibration deviations. These deviations are normally not evaluated in a tier II data review. Sample results that had continuing calibration recoveries that exceed the control limit high and were non detect did not require qualification. Sample results where the calibration recoveries were high and the compound was detected or calibration recoveries were low were qualified as estimated (J or UJ).

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR SVOCs

PESTICIDE ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Herbicide analysis requires that one of the two pesticide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
PSCB-41R(0.5-2)	Aldrin	<LL but >10%	--
	alpha-BHC	<LL but >10%	--

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

7. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 40%.

Sample locations associated with %D analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	%D
PSCB-41R(0.5-2)	4,4'-DDD	97.7%

The criteria used to evaluate the %D are presented in the following table. In the case of a %D deviation, the sample results are qualified as documented in the table below.

Control Limit (%D)	Qualification
>40% to 70%	J
>70% to 100%	JN
>100% [1]	R
>100% to 200% (Interference detected)[2]	J or JN
>50% (pesticide) sample results less than the RL)	U

When the pesticide sample results are less than the RL and the %D greater than 50% the sample result are raised to the RL and reported as non-detect.

Notes:

1: If the pattern is confirmed sample results will be qualified as estimated (J). If pattern exhibits interference or if the pesticide cannot be positively determined due to weathering the sample results will be qualified as tentative identification estimate (JN).

2: If interference is detected in either column the sample results will be qualified as tentative identification estimate (JN).

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR PESTICIDES

POLYCHLORINATED BIPHENYLS (PCBs) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that one of the two PCB surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD was not performed on a sample within this SDG.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

7. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (%RPD) of detected sample results must be less than 40%.

No Aroclors were detected in the samples within this SDG.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 6010D, 7471A, and 9012B. Data were reviewed in accordance with the USEPA CLP National Functional Guidelines for Inorganic Superfund Methods Data Review, EPA 540/R-2017-001, January 2017; and the USEPA CLP National Functional Guidelines for Inorganic Data Review, EPA 540-R-01-008, July 2002 (as applicable).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
  - J The reported value was obtained from a reading less than the reporting limit (RL), but greater than or equal to the method detection limit (MDL).
- Quantitation (Q) Qualifiers
  - E The reported value is estimated due to the presence of interference.
  - N Spiked sample recovery is not within control limits.
  - * Duplicate analysis is not within control limits.
- Validation Qualifiers
  - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The analyte was not detected above the reporting limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
  - UB Analyte considered non-detect at the listed value due to associated blank contamination.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010D	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471A	Soil	28 days from collection to analysis	Cool to <6 °C.
SW-846 7470A	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No qualification of the sample results was required.

3. Matrix Spike (MS)/Matrix Spike Duplicate(MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
S-111(2-4) (04-23-2019)	Mercury	88.3%	54.1%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications for all metals are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD analysis exhibited RPDs within the control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

All analytes associated with MS/MSD recoveries were within control limits.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis exhibited RPD within control limits.

4. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Sample Summary

Arcadis

Job No: JC95610

National Grid, Philly Coke, Philadelphia, PA
Project No: B0036790.0001.00002

Sample Number	Collected Date	Time	By	Received	Matrix Code	Matrix Type	Client Sample ID
JC95610-1	09/25/19	09:30	CO	09/25/19	SO	Soil	WC-092519

This report contains results reported as ND = Not detected. The following applies:
Organics ND = Not detected above the MDL

Soil samples reported on a dry weight basis unless otherwise indicated on result page.

CASE NARRATIVE / CONFORMANCE SUMMARY

Client:	Arcadis	**Job No**	JC95610
Site:	National Grid, Philly Coke, Philadelphia, PA	**Report Date**	10/9/2019 4:19:55 PM

On 09/25/2019, 1 Sample(s), 0 Trip Blank(s) and 0 Field Blank(s) were received at SGS North America Inc. at a maximum corrected temperature of 3.3 C. Samples were intact and chemically preserved, unless noted below. A SGS North America Inc. Job Number of JC95610 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Compounds qualified as out of range in the continuing calibration summary report are acceptable as per method requirements when there is a high bias but the sample result is non-detect.

MS Volatiles By Method SW846 8260C

Matrix: LEACHATE **Batch ID:** V3D6388

- All samples were analyzed within the recommended method holding time.
- Sample(s) JC95392-5MS, JC95392-5MSD were used as the QC samples indicated.
- All method blanks for this batch meet method specific criteria.
- RPD(s) for MS/MSD for 1,1-Dichloroethene, 1,4-Dichlorobenzene, Chloroform are outside control limits.Analytical precision exceeds in-house control limits.

MS Semi-volatiles By Method SW846 8270D

Matrix: LEACHATE **Batch ID:** OP23137

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JC95821-11ALS, JC95821-11AMS, JC95821-11AMSD were used as the QC samples indicated.
- Matrix Spike Recovery(s) for Pyridine are outside of in house control limits.
- JC95610-1 for 2,4-Dinitrotoluene: Associated CCV outside of control limits high, sample was ND.

GC/LC Semi-volatiles By Method SW846 8082A

Matrix: SO **Batch ID:** OP23056

- All samples were extracted within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JC95413-1MS, JC95413-1MSD were used as the QC samples indicated.
- JC95610-1 for Tetrachloro-m-xylene: Outside control limits due to matrix interference.
- JC95610-1 for Decachlorobiphenyl: Outside control limits due to matrix interference.

Metals Analysis By Method SW846 6010D

Matrix: LEACHATE **Batch ID:** MP17700

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JC95821-11AMS, JC95821-11AMSD, JC95821-11ASDL were used as the QC samples for metals.
- RPD(s) for Serial Dilution for Lead, Silver are outside control limits. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).

Metals Analysis By Method SW846 7470A

Matrix:	LEACHATE	Batch ID:	MP17705

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JC95821-11AMS, JC95821-11AMSD were used as the QC samples for metals.

General Chemistry By Method SM2540 G 18TH ED MOD

Matrix:	SO	Batch ID:	GN708

- Sample(s) JC95922-2DUP were used as the QC samples for Solids, Percent.

General Chemistry By Method SW846 9045D

Matrix:	SO	Batch ID:	GN875

- Sample(s) JC95639-5ADUP were used as the QC samples for Corrosivity as pH.

SGS North America Inc. certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

SGS North America Inc. is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by SGS North America Inc indicated via signature on the report cover

Instrument Performance Check (BFB)

Job Number: JC95610
Account: BBLNYS Arcadis
Project: National Grid, Philly Coke, Philadelphia, PA

Sample: V3D6388-BFB
Lab File ID: 3D149450.D
Instrument ID: GCMS3D
Injection Date: 09/30/19
Injection Time: 08:10

m/e	Ion Abundance Criteria	Raw Abundance	% Relative Abundance		Pass/Fail
50	14.99 - 40.0% of mass 95	16802	16.6		Pass
75	30.0 - 60.0% of mass 95	45538	45.0		Pass
95	Base peak, 100% relative abundance	101098	100.0		Pass
96	5.0 - 9.0% of mass 95	6538	6.47		Pass
173	Less than 2.0% of mass 174	0	0.00	(0.00) [a]	Pass
174	50.0 - 120.0% of mass 95	93880	92.9		Pass
175	5.0 - 9.0% of mass 174	7392	7.31	(7.87) [a]	Pass
176	95.0 - 101.0% of mass 174	90386	89.4	(96.3) [a]	Pass
177	5.0 - 9.0% of mass 176	6225	6.16	(6.89) [b]	Pass

(a) Value is % of mass 174
(b) Value is % of mass 176

Clean Earth of North Jersey, Inc. Underlying Hazardous Constituent (UHC) LDR Form

GENERATOR NAME: Philadelphia Coke c/0 Niagara Mohawk Power Corp.- Richmond St. Phil, PA **MANIFEST DOC. NO.:** 20997921 JJK

APPROVAL CODE #: 193081626

If D001through D043 requires treatment to 268.48 standards, then each underlying hazardous constituent present in the waste at the point of generation, and at a level above the UTS constituent specific treatment standard, must be listed. Write the letter (A,B1,B2,C or D) which corresponds to the letter found on Clean Earth of North Jersey, Inc. LDR Notification and Certification Form (page 2), beside each constituent present, to properly described how the constituent(s) must be managed under 40 CFR 268.7. If no underlying hazardous constituents are present, please check appropriate section on Page 2 of this form.

[1]These concentrations are expressed in mg/l and are measured through an analysis of TCLP extract; all others measured through a total waste analysis.

[2]These constituents are not Underlying Hazardous Constituents in characteristic wastes, according to the definition at 268.2(i).

☐ This waste stream contains none of the Underlying Hazardous Constituents (UHC's) listed above or on Page 1, above the UHC's specific treatment standard (UTS) at the point of generation.

The information above was determined by:

☒ Generator's knowledge of the waste
☐ Laboratory analysis

Approval #:

This is to document the disposition of waste materials receieved from your facility between 2/17/2020 8:16:23 PM and 2/17/2020 8:16:23 PM on the following Manifest numbers:

Manifest	Management Method	Arrived
020997921JJK	H110	2/17/2020

The material was shipped from Clean Earth of North Jersey on the following manifests to the following facilities:

Manifest	Shipped	TSDF
9126024	03/25/2020	Fairless Hills Landfill
9126023	03/25/2020	Fairless Hills Landfill
9126021	03/25/2020	Fairless Hills Landfill
9126020	03/25/2020	Fairless Hills Landfill

Clean Earth of North Jersey

***** CERTIFICATE OF DISPOSAL *****

1/10/2022

Site: Philadelphia Coke Co, Inc
4501 Richmond St
Philadelphia, PA 19137

Epa Id #: PAD000427906

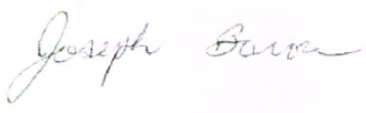
Approval #:

The disposition of all material is in accordance and compliance with all required and applicable federal and state laws and regulations. Clean Earth of North Jersey's EPA ID is NJD991291105.

Please be advised that those waste streams showing multiple outgoing shipments may have been comingled with other waste prior to shipment.

Thank you for the opportunity to be of service.

Very truly yours
Clean Earth of North Jersey



Joe Barone Operations Manager

Notes:

1. Well Data from the Pennsylvania Topographic & Geologic Survey Database (accessed via web on October 13, 2020).
2. Per the Philadelphia Water Department Records, residents around the Site consume City water.
3. According to the Pennsylvania Groundwater Information System Website, the one domestic well located near the Site is also listed for monitoring. The one domestic well is located on a property where there is a historical diesel release. Therefore, it is likely that this well was used for and/or continues to be used for Monitoring Purposes only. More information is available in Subsection 3.2.2.1 of the Remedial Investigation Report.

RE: PCB Remediation at the Former Philadelphia Coke Company Facility: Historical Tar Plains/Fill Area, 4501 Richmond Street, Philadelphia, PA; # 2021-61-012

Dear Mr. Brussel:

This letter is in response to Philadelphia Coke Company, Inc's (PCC) notification and certification, dated December 1, 2021, provided to the U.S. Environmental Protection Agency Region III (EPA) pursuant to the requirements of the *Self-implementing on-site cleanup and disposal of PCB remediation waste* regulation, 40 C.F.R. § 761.61(a). This notification was submitted by John Brussel, Arcadis U.S., Inc., on behalf of PPC, regarding PPC's plan to conduct on-site disposal of polychlorinated biphenyl (PCB) contaminated soils found in the Historical Tar Plains/Fill Area of the Former Philadelphia Coke Company Facility located at 4501 Richmond Street in Philadelphia, Pennsylvania.

In its notification, PPC has proposed the following PCB cleanup and disposal plan:

- On-site disposal and capping of the soils with PCB concentrations of greater than 1 ppm and less than or equal to 10 ppm in the Historical Tar Plains/Fill Area;
- capping half of the PCB-containing soils with a 6 inch asphalt cap in compliance with § 761.61(a)(7) and capping the other half with an alternate soil cap consisting of 24 inches of compacted soils and a geotextile membrane;
- the recording of deed restriction in compliance with § 761.61(a)(8) noting the existence and required maintenance of the caps; and
- decontamination of all PCB-contaminated movable equipment with an alternate to the self-implementing decontamination procedure found in § 761.79(c)(2).

EPA has reviewed PPC's notifications for the Historical Tar Plains/Fill Area of the Former Philadelphia Coke Company Facility and finds that it is consistent with the requirements of 40 C.F.R.

§ 761.61(a) except for the soil cap. Section 761.61(a)(7) requires the use of a minimum of ten (10) inches of compacted soil meeting the permeability, sieve, liquid limit, and plasticity index parameters in § 761.75(b)(1)(ii) through (b)(1)(v). PPC has proposed the use of soil which does not comply with the parameters in § 761.75(b)(1)(ii) through (b)(1)(v) but PPC will use a minimum of 24 inches of compacted soil underlain with a geotextile membrane to demarcate between the clean and PCB-containing soils. Based on the site specific conditions and low PCB levels in the soil, this alternate soil cap will present no unreasonable risk of injury to health or the environment and is being approved under § 761.61(c).

The self-implementing decontamination procedure for movable equipment set forth at § 761.79(c)(2) requires the swabbing of the surfaces with a solvent and then a double wash/rinse as defined in Subpart S. PPC has proposed using in place of the solvent, an industrial strength detergent or non-ionic surfactant solution (e.g., Alconox Detergent 8, Aqua-Cleen®) applied via high-pressure water spray/steam cleaner and brushing to remove adhered debris. The equipment surfaces will then be triple-rinsed and visually inspected following rinsing. If the visual inspection indicates that waste materials remain, the equipment will be re-cleaned and re-inspected. A field demonstration test will then be conducted for one of each of the individual types of construction equipment that have contact with PCB-containing soils to document that the decontamination method is sufficiently rigorous to reduce PCB concentrations on the equipment surfaces to the high occupancy non-porous cleanup level of less than or equal to 10 $\mu g/100cm^2$ as set forth at § 761.61(a)(4)(ii). The field demonstration test will use the standard PCB wipe test and follow the requirements of Subpart P. Upon the completion of a successful field demonstration for one of each of the individual types of construction equipment contacting PCB-containing soils, the standard PCB wipe test will not be repeated. This alternate decontamination procedure should present no unreasonable risk of injury to health or the environment and EPA is approving this alternate self-implementing decontamination procedure under the provisions of § 761.79(h) with the condition that the field demonstration test results with accompanying lab report and photographic documentation of the field demonstration are provided, via email, to and approved by the EPA Region 3 PCB Coordinator prior to implementation of the alternate decontamination procedure. Decontamination waste and residues shall be disposed of at their existing PCB concentration.

EPA hereby approves the on-site disposal and capping of PCB containing soils found in the Historical Tar Plains/Fill Area of the Former Philadelphia Coke Company Facility located at 4501 Richmond Street, Philadelphia, Pennsylvania, submitted with PPC's notification and certification, dated December 1, 2021. PPC may proceed with its cleanup in accordance with 40 C.F.R. §§ 761.61(a) and (c) and 79(h); its notification and this approval. This approval is subject to the conditions and limitations set forth in 40 C.F.R. § 761.61(a) and 79(h). The approved plan may be modified only in accordance with the procedures described at 40 C.F.R. § 761.61(a)(3)(ii).

EPA notes that within sixty (60) days of completion of the cleanup activities the owner of the property shall submit to the Director of the Land, Chemicals and Redevelopment Division of EPA Region III a copy of the deed restriction and a signed certification, as specified in 40 C.F.R. § 761.61(a)(8)(i)(B). The deed restriction shall indicate that PCB remediation waste at concentrations between 1 and 10 ppm has been left in place, the location of the PCB remediation waste, the existence, location and types of caps, that the caps must be maintained and written EPA permission must be obtained prior to breaching the caps.

EPA's approval of PPC's cleanup plan does not in any way constitute a finding by EPA that the soils in the Historical Tar Plains/Fill Area of the Former Philadelphia Coke Company Facility located at

4501 Richmond Street, Philadelphia, Pennsylvania will be safe or appropriate for any future use, does not insulate the owner of the site from action under any applicable law, and does not relieve PPC of its continuing responsibility to comply fully with 40 C.F.R. Part 761. EPA emphasizes that these regulations include several conditions and limitations that apply to persons performing a PCB cleanup activity subject to 40 C.F.R. § 761.61(a). Among other things, the regulations state that "[c]omplete compliance with 40 C.F.R. § 761.61 does not create a presumption against enforcement action for penalties for any unauthorized PCB disposal," 40 C.F.R. § 761.50(b)(3)(ii)(B). Further, "[a]ny person storing or disposing of PCBs is also responsible for determining and complying with all other applicable Federal, state, and local laws and regulations," 40 C.F.R. § 761.50(a)(6).

EPA encourages the compliance with greener cleanup practices for all cleanup projects and recommends adherence to the ASTM Standard Guide to Greener Cleanup E2893-13 (Guide) for work conducted under this approval and the notification. Greener cleanups is the practice of integrating options that minimize the environmental impacts of cleanup actions in order to incorporate practices that maximize environmental and human benefit. The Greener Cleanup Best Management Practices (BMPs) Process is found in Section 6 of the Guide. See www.astm.org/Standards/E2893.htm for additional information. EPA encourages you to review the Guide and implement any practices that are feasible. If implemented, the PCB completion report should include a section on BMP documentation, as described in Section 6.6.5 of the Guide.

EPA is requesting that an electronic copy summarizing the completed cleanup activities, including but not limited to, characterization and confirmation sampling analytical results; copies of the accompanying analytical chains of custody; field and laboratory quality control/quality assurance checks; copies of manifests; copies of certificates of disposal or similar certifications issued by the disposer and total amounts of PCB waste disposed, be submitted within sixty (60) days of completion.

The field demonstration documentation, the completion report and any questions concerning this approval or the self-implementing site cleanup plan review should be directed to Ms. Kelly Bunker, EPA Region III PCB Coordinator, at bunker.kelly@epa.gov or 215-814-2177.

Sincerely,

Dana Aunkst, Director
Land, Chemicals, and Redevelopment Division

Subject: *Self-Implementing Cleanup Notification for PCB Remediation Waste – Revision 1 (FINAL)*
Former Philadelphia Coke Co. Facility
PADEP eFACTS PF No. 831308
EPA ID #PAD000427906
4501 Richmond Street
Philadelphia, Philadelphia County, Pennsylvania

Dear Mr. Aunkst,

On behalf of the Philadelphia Coke Co., Inc. (PCC), Arcadis U.S., Inc. (Arcadis) is submitting this self-implementing cleanup notification for planned remedial activities to address polychlorinated biphenyl (PCB) remediation waste at the former Philadelphia Coke Plant located in the Bridesburg borough of Philadelphia, Pennsylvania (the Site). This letter also presents an alternative decontamination procedure approval request for decontamination of construction equipment to be used during implementation of the remedial activities. This notification is being submitted to the United States Environmental Protection Agency (EPA) in accordance with the Toxic Substances Control Act (TSCA) regulations presented in Title 40 of the Code of Federal Regulations (CFR) Part 761.61(a). A signed Certification Statement containing information required under 40 CFR 761.61(a)(3)(E) is included as Attachment 1 to this letter.

Analytical results for PCBs in soil samples collected at the Site were presented in a *TSCA PCB Evaluation Summary* submitted to the EPA's Resource Conservation and Control Act (RCRA) project manager, Kevin Bilash, on May 12, 2021. The submittal evaluated whether PCBs identified at the Site by previous environmental investigation are regulated under TSCA and was supported by data tables, figures, and historical aerial photographs. The summary concluded that PCBs identified in soil samples collected at the Site are related to pre-April 1978 release(s) and the observed PCB concentrations are therefore not regulated under TSCA.

In a July 8, 2021 response letter from the EPA to Arcadis, EPA agreed with the conclusions of the *TSCA PCB Evaluation Summary*, except for a portion of the Site in the southeast corner referred to as the "Historical Tar Plains / Fill Area" because soil containing PCBs in this area is located in backfill that was placed during the RCRA closure activities conducted in the 1980s to the early 1990s (discussed in Section I.B. below). Accordingly, EPA requested that PCC submit a self-implementing cleanup notification for PCB remediation waste in this limited area. Therefore, this notification addresses the PCB impacts in the Historical Tar Plains / Fill Area. The EPA response letter indicates that PCB impacts in the areas outside the Historical Tar Plains / Fill Area should be addressed in conjunction with the cleanup activities being performed under the One Cleanup Program. The *TSCA*

PCB Evaluation Summary and follow-up correspondence between Arcadis and EPA are provided in Attachment 2 to this letter.

The Site is being remediated in accordance with Pennsylvania's Land Recycling and Environmental Remediation Standards Act (Act 2), and its enabling regulations, 25 PA Code, Chapter 250. The proposed cleanup activities and Site redevelopment are described in the Remedial Investigation Report and Cleanup Plan (RIR/CP) submitted to the Pennsylvania Department of Environmental Protection (PADEP) and the EPA's RCRA project manager on July 15, 2021. In addition, the cleanup approach and proposed redevelopment was presented to PADEP staff and EPA's RCRA project manager during a March 8, 2021 meeting between PCC, the prospective site developers, PADEP, and the EPA.

Cleanup activities in the limited area covered by this notification will be conducted simultaneously with the Pennsylvania Act 2 site-wide cleanup action proposed in the RIR/CP. Cleanup activities will be integrated with Site development plans, once finalized. Conceptual development plans are currently being prepared and include commercial warehouse buildings, parking lots, access roads, driveways, and various landscape features, as shown in Attachment 3.

Relevant background information, a summary of PCB characterization results, and a description of the proposed PCB cleanup activities are presented below.

I. Background Information

A. Site Location

The Site is located at 4501 Richmond Street between Orthodox Street and Buckius Street and is adjacent to the Delaware River. The Site is approximately 63 acres in size and is currently unoccupied. The Site is overgrown with vegetation and only remnants of the former operating structures, foundations, and concrete pads remain. All former structures at the Site have been demolished to ground level, and the Site is currently vacant. A mix of residential, industrial, and commercial uses surround the Site. The Site location is shown as Figure 1.

B. Site and Regulatory History

The Site was used as a manufactured gas plant in the mid-1920s and coking facility from 1929 to 1982. Coal and Coke Storage Areas were located in the northern portion of the Site. The main Coking Operations Area was located in the center of the Site and consisted of the coke ovens, a byproducts building, tar storage, and oxide boxes. The Site also included an iron oxide waste area and tar plains. A fuel oil blending facility operated on the eastern 2.5 acres of the Site from approximately 1969 through 1989. The Fuel Blending Area consisted mainly of aboveground storage tanks and below ground piping. All Site operations concluded in 1989.

PCBs were not a raw material, product, or byproduct of either MGP or coking operations. Although historical facility mapping shows an electrical substation building in the west-central portion of the Site, aerial photos do not show electrical equipment outside of the building. There are no known or suspected releases from equipment inside the electrical substation building.

RCRA closure actions were conducted at the Site from 1988 to 1993 to address source area contamination located at specific RCRA Hazardous Waste Management Units (HWMUs) and Solid Waste Management Units (SWMUs), as follows:

- HWMUs – Approximately 9,400 tons of soil contaminated with decanter tank tar sludge from coking operations (RCRA Waste Code K087), spent iron oxide from the coal carbonization process (RCRA Waste Code D003), and benzene from production (RCRA Waste Code D018) associated with six HWMUs (tar storage tanks, waste liquor pit, tar plains, tar decanters, iron oxide boxes and pile, and seal pot) were excavated and transported for offsite disposal as hazardous waste.
- SWMUs – Approximately 29,400 tons of coke breeze, coal tar-impacted soil, and paving material from four SWMUs (trash pile, clean oxide, wood trays, and process piping) were excavated and transported for offsite disposal as a non-hazardous waste.

The Certificate of Completion for RCRA Site Closure was issued on December 28, 1994. No outstanding closure responsibilities associated with the RCRA Corrective Action remain.

In addition to the above RCRA Site Closure activities, separate cleanup activities were initiated in 1992 to address oily residues encountered in the Fuel Blending Area. These activities included the excavation and disposal of potential fuel oil sources consisting of subsurface piping and oil residues from the basement of the former pump house. A bioremediation project was conducted for almost two years and reported moderate success in reducing hydrocarbon concentrations in the surface soils (0 to 3 feet below ground surface [bgs]), but only limited success with the deeper contamination. The project was discontinued in late 1993. The above-grade Fuel Blending Area facilities were dismantled and removed in early 1998.

Lastly, seven underground storage tanks (USTs) were removed from the Site in 1992. The UST closures were approved in June 1992 by the agency preceding PADEP. Each UST excavation was backfilled with clean fill.

The Site has not been occupied since the conclusion of the RCRA Site Closure. Other than the Site investigations discussed herein and in the RIR, no other Site activities or operations besides routine mowing and perimeter chain-link fence maintenance have been conducted since the RCRA Closure was certified in 1994.

In 2013, EPA-certified Environmental Indicator Forms were completed and indicated that both human exposures and impacted groundwater migration are under control at the Site. Any further work needed will be performed to satisfy the requirements of PADEP Act 2 and TSCA.

II. Environmental Investigation Summary

A multi-phase Remedial Investigation (RI) was undertaken to assess the nature and extent of Site-related environmental impacts and evaluate the risks posed to human health and the environment by those impacts. The RI was performed in two major phases: (1) the Initial RI activities from 2003 through 2006; and (2) the Supplemental RI activities in 2018 and 2019. As part of the RI, soil, soil gas, and groundwater investigations were performed to characterize remaining residuals. Over the course of these investigations, 46 monitoring wells were installed, 197 test pits were excavated, 179 soil borings were drilled, 21 soil gas samples were collected, and hundreds of samples of environmental media were analyzed. The existing Site layout and RI sampling locations are shown on Figure 2. In total, approximately 97 groundwater and 117 soil samples were analyzed for PCBs.

PCBs were not detected in groundwater above the laboratory reporting limit (ranging from 0.25 parts per billion [ppb] to 0.36 ppb). Samples were collected from 41 monitoring wells distributed across the Site (including the

groundwater monitoring well downgradient from the Historical Tar Plains / Fill Area [PCMW-10S]). Therefore, groundwater investigation results are not further discussed in this letter.

As part of the RI activities, soil samples were collected from 89 sampling locations distributed across the Site and analyzed for PCBs. Surface soil samples were collected from the top 2 inches (below the sod layer, if present) of a 1-square-foot surface area, and subsurface soil samples were collected from select depths bgs at soil boring and test pit locations. PCB analyses were performed by an Environmental Laboratory Accreditation Program-certified laboratory using EPA SW-846 Method 8082. PCBs were not identified in any of the samples at concentrations greater than 50 parts per million (ppm). PCBs were detected at concentrations greater than 1 ppm in only 11 of the 89 sampling locations (four in the Historical Tar Plains / Fill Area as discussed in the subsection below). The soil sampling locations where PCBs have been identified at concentrations greater than 1 ppm are shown on Figure 3. The soil analytical results for total PCBs are presented in Table 1. As presented in the *TSCA PCB Evaluation Summary*, PCBs identified in soil samples collected at the Site are related to pre-April 1978 release(s) and the concentrations are therefore not regulated under TSCA, except for a portion of the Site in the southeast corner referred to as the Historical Tar Plains / Fill Area. A more detailed summary of the PCB analytical results for the soil samples collected outside the Historical Tar Plains / Fill Area is presented in the TSCA PCB Evaluation Summary. The PCB analytical results for soil samples collected from the Historical Tar Plains / Fill Area are summarized below.

PCBs have been identified at a concentration greater than 1 ppm in 4 of 17 soil samples collected from the Historical Tar Plains / Fill Area (samples PSSTP-08A, PSSTP-09A, PSSTP-19A, and PCTP-61). PCB analytical results for soil samples collected from this area are presented in Table II below:

Table II – PCB Concentrations in the Historical Tar Plains / Fill Area

Location ID	Sample Depth (ft bgs)	Date Collected	Total PCBs (ppm)
PCTP-61	0.5	9/8/05	**1.3** [0.54]
	7.5	9/8/05	<0.027
PCTP-62	0.5	9/8/05	0.58
	10.5	9/8/05	<0.042
PCTP-63	0.5	9/8/05	0.23
	10.5	9/8/05	<0.035
PCTP-80	8	9/12/05	0.31
PSSTP-07A	1-2	3/11/03	0.18
	8-9	3/11/03	<0.021
PSSTP-07R	0.5-2	4/18/19	<0.04 [0.0610]
	8-9	4/18/19	<0.037
PSSTP-08A	1-2	3/11/03	0.12
	6-7	3/11/03	**1.2**
PSSTP-09A	1-2	3/12/03	0.05
	6-7	3/12/03	**8.9**
PSSTP-19A	1-2	3/12/03	0.23
	7-8	3/12/03	**1.1**

Notes:

1. < indicates PCBs were not detected at a concentration above the reported detection limit.
2. Brackets indicate the reported concentration of a duplicate sample.
3. Bold results are greater than 1 ppm.

Soil and debris were removed from this area to an average depth of approximately 11 feet during RCRA closure between 1982 and 1988. Approval to backfill was provided in 1989 by the agency preceding PADEP. The Initial RI samples from this area that contained PCBs at concentrations greater than 1 ppm were collected within backfill placed as part of the RCRA excavations. The random areal distribution and depths of soil impacted with low-level PCBs across this area are not indicative of a historical point source release, but rather low-level impacts in fill material. Of the four samples over 1 ppm, three are just slightly over the standard, ranging from 1.1 to 1.3 ppm, and only one sample is of surface soils (PCTP-61(0.5)).

Per TSCA, soil containing PCBs at concentrations greater than 1 ppm but less than or equal to 10 ppm may remain in a “high occupancy area” provided that it is covered with a cap in accordance with the regulation in 40 CFR 761.61(a)(4)(i)(A). Portions of the Site may be occupied by workers at a frequency greater than 6.7 hours per week. Therefore, the Site will be remediated in accordance with EPA’s definition of a “high occupancy area” as presented in 40 CFR 761.3, which would allow for residential use. However, due to residual impacts (other than PCBs) remaining onsite, the Site will be restricted to non-residential use.

III. Proposed Self-Implementing Cleanup Activities

The cleanup activities proposed for the Site will provide conditions that are protective of human health for high-occupancy site use. The objectives with respect to the remediation of PCB-impacted soil are, to the extent practicable, to: (1) prevent ingestion/direct contact with impacted surface and subsurface soil; (2) prevent the migration of PCBs that would result in exceedances of the 0.5 part per billion (ppb) EPA unrestricted cleanup level for water; and (3) prevent impacted soil migration to surface water. As previously indicated, groundwater at the Site is not impacted by PCBs.

The primary cleanup activities covered under this notification include: (1) installing engineered caps(s) above the remaining soil that contains PCBs at concentrations greater than 1 ppm; and (2) establishing institutional controls in the form of an environmental covenant with deed restrictions/notifications to establish certain limitations and protocols for future site operations based on the impacts that will remain at the completion of the cleanup activities. Due to the presence of other residual impacts remaining onsite (including but not limited to PCBs), the proposed cap will be Sitewide. Site development and capping will be performed in accordance with an Erosion and Sedimentation Control (E&SC) Plan.

The proposed cap may include concrete floor slabs/foundations for new buildings; asphalt pavement and/or concrete for driveways, parking areas, and sidewalks; and/or 2-feet of clean soil (e.g., in landscaped areas) to eliminate potential direct contact with soil containing PCBs. Details on the proposed capping are presented in Section III.A.2. The cleanup activities proposed for the Site also address: (1) Site COCs in surface and subsurface soil; and (2) vapor intrusion (VI) concerns for future buildings onsite using engineering controls (i.e., via use of a vapor barrier specifically designed, manufactured and installed for use in VOC mitigation). VI mitigation is unrelated to the PCB self-implementing cleanup notification and is therefore not further discussed further herein.

An environmental covenant with deed restrictions/notifications meeting the requirements of 40 CFR 761.61(a)(8) will be incorporated as an institutional control. Due to the presence of residual impacts other than PCBs remaining onsite, Site use will be restricted to non-residential to limit potential future receptors, and groundwater use will be prohibited to eliminate potential future groundwater exposure pathways. In addition, institutional controls will stipulate inspection, periodic maintenance/repair activities, and reporting requirements for the caps, as appropriate. Details on the proposed institutional controls are provided in Section III.C.

The proposed redevelopment and installation of engineering controls are scheduled to begin in 2022, subject to PADEP and EPA approval of the RICP. The subsection below discusses the primary elements of the selected cleanup action as related to PCB soil impacts.

A. Detailed Description of Cleanup Action for Soil

The selected cleanup action for soils containing PCBs in the Historical Tar Plains / Fill Area at concentrations greater than 1 ppm and less than 10 ppm is capping with either concrete, asphalt, or two feet of clean fill.

Although unlikely, any soil that needs to be excavated from the Historical Tar Plains / Fill Area because of grade adjustment, utility installation, or foundation work will be relocated, consolidated, and capped within the Historical Tar Plains / Fill Area. Soil originating from the Historical Tar Plains / Fill Area will not be relocated outside the limits of this area for consolidation. If soil needs to be removed from the Site (e.g., from the area of PSSTP-01A, for geotechnical reasons), it will be characterized and disposed of at a facility permitted to accept the material. The anticipated disposal facility to be used for PCB-impacted soil from the Site (if any) is Clean Earth of North Jersey located on 115 Jacobus Avenue in South Kearney, New Jersey. An alternate registered RCRA Subtitle D landfill may be used depending on landfill availability for the material quantity/timing or market factors. The name of the alternative landfill (if proposed) will be provided to EPA before being used. Any soil leaving the Site will be characterized for PCBs. Based on analytical data, geotechnical data, and current redevelopment plans, soil in the Historical Tar Plains / Fill Area will not need to be excavated.

During implementation of the cleanup work (and any Site redevelopment if applicable) specific environmental controls, decontamination, health and safety requirements, and soil management, handling, and disposal requirements will be followed. Work conducted on the Site will be in accordance with the procedures defined in the RIR/CP, this notification, and a site-specific HASP.

The proposed cleanup actions and associated construction requirements for the Historical Tar Plains / Fill Area are summarized below.

1. Earthwork and Soil Management

At the start of construction, the Site will be surveyed and staked/marked to identify the Historical Tar Plains / Fill Area covered under this notification. In addition, sampling location PCTP-61 will be surveyed and marked because PCBs were detected in surface soil at this location at a concentration greater than 1 ppm. If feasible, fill will be added to this area during redevelopment in such a way that equipment will not contact soil containing PCBs greater than 1 ppm (i.e., surface soil impacts at PCTP-61 will be covered without disturbing existing soil). Any potential ground-intrusive activities that may disturb, or have the potential to disturb, impacted soil will be monitored.

Site grading or excavation activities within marked areas will be documented to identify the relocation of any impacted soils. Soil onsite can be reused as fill in areas that will be covered as part of site redevelopment. Impacted soil that is excavated will be managed in accordance with the PADEP Guidelines for E&SC. At a minimum, the E&SC measures will include silt fencing, compost filter socks, and/or hay bales that will be installed in appropriate locations in and around the remedial work area to minimize potential transportation of surface soil via wind and/or surface water, to areas outside of the limits of disturbance. If staged, impacted soil will be placed on polyethylene sheeting (minimum 6 mil thickness) adjacent to the excavation area and kept covered with appropriately anchored tarps when inactive. Small quantities of waste, along with drums of used PPE and similar

small debris type items, may be stored in labeled United States Department of Transportation-specification containers before onsite reuse or offsite disposal.

If soil is not suitable from a geotechnical perspective for use as subsurface fill and removed from the site, it will be:

- Characterized in accordance with the disposal facility's requirements.
- Transported by a permitted waste hauler contracted to transport waste materials to the certified waste disposal facility in accordance with appropriate local, State, and Federal regulations.
- Documented in a waste manifest containing a summary of transport tonnage and disposal destination. The waste manifest will be maintained onsite and submitted to PADEP in the Final Report.

For any materials disposed offsite, disposal quantities and associated documentation will be presented in the Final Report. This documentation will include waste profiles, test results, facility acceptance letters, manifests, bills of lading, and facility receipts.

2. Capping System Details and Deviations from TSCA

Based on current redevelopment plans, approximately half of the Historical Tar Plains / Fill Area will be covered by asphalt parking lots and the other half will be covered by landscaping. The asphalt parking lot will be 6 inches thick and conform to 40 CFR 761.61(a)(7). However, the 24-inch soil cover will not meet the permeability, sieve, liquid limit, and plasticity index parameters in 40 CFR 761.75(b)(1)(ii) through (b)(1)(v). The soil cover will consist of two feet of clean fill, including landscaping topsoil, in the greenspace and other landscaped areas. The soil cover will be underlain by a geotextile fabric to serve as a visual demarcation between the clean fill cap and the existing impacted soil. The limits of the various soil cover (cap) components will be documented. A Post-Remediation Care Plan (part of the institutional controls) will be developed for long-term care and maintenance of the final cap(s).

The alternative capping system is considered protective of human health for the following reasons:

1. Groundwater at the Site is not impacted by PCBs, and the Site has been vacant and open to stormwater infiltration since the completion of the RCRA cleanup action in 1993.
2. The random areal distribution and depths of soil impacted with low-level PCBs in the Historical Tar Plains / Fill Area are not indicative of a historical point source release. In fact, three of the four samples over 1 ppm in this area are just slightly in excess of 1 ppm (i.e., 1.1 to 1.3 ppm) and the fourth sample is under 10 ppm.
3. The environmental covenant and deed restriction will prohibit groundwater use at the Site in the future.
4. A stormwater management system consisting of storm sewer catch basins, manholes, and subgrade piping will be designed to minimize infiltration through residual impacted soil and to convey storm water run-off from the Site.
5. The proposed soil cover is more than double the thickness required under 40 CFR 761.61(a)(7), and it will be underlain by a demarcation layer.

B. Equipment Decontamination

Under the provisions of 40 CFR 761.79(h), PCC is requesting to decontaminate PCB remediation equipment using a self-implementing procedure other than prescribed in 40 CFR 761.79(c)(2). If any equipment contacts soil containing PCBs greater than 1 ppm (e.g., surface soil at or near sampling location PCTP-61), the surfaces of that equipment which were in contact with the soil will be cleaned using an industrial strength detergent or non-ionic surfactant solution (e.g., Alconox Detergent 8, Aqua-Cleen®) applied via high-pressure water spray/steam cleaner and brushing to remove adhered debris. The equipment surfaces will then be triple-rinsed and visually inspected following rinsing. If the visual inspection indicates that waste materials remain, the equipment will be re-cleaned and re-inspected. The cleaning will be performed in a decontamination area. The decontamination procedures deviate from the procedures in 40 CFR 761.79(c)(2) and Subpart S because a wash cycle with an organic solvent will not be used. Accordingly, a field demonstration test will be conducted to document that the decontamination method is sufficiently rigorous to reduce PCB concentrations on equipment surfaces. After a successful field demonstration test, as described below, wipe samples will not be collected from each equipment item that is decontaminated.

As part of the field demonstration, standard PCB wipe samples (10-centimeter [cm] by 10-cm, as defined in 40 CFR 761.123) will be collected following decontamination of equipment used to handle PCB impacted soil. In general accordance with 40 CFR 761.302 (Subpart P), a minimum of three wipe samples will be collected from each individual decontaminated construction equipment that contacted PCB impacted soil (e.g., if one excavator and one loader are decontaminated, six wipe samples will be collected). If the equipment surface area appears to be greater than 30 square meters (323 square feet), a fourth wipe sample will be collected. Sample locations will focus on areas that contacted PCB soils (e.g., excavator bucket, excavator/bulldozer tracks, bulldozer blade) and for these areas, the sample locations will be determined following the random number generator method presented in 40 CFR 761.308. These samples will be submitted for laboratory analysis for PCBs using USEPA SW-846 Method 8082. If PCBs are detected in the wipe samples at concentrations equal to or exceeding 10 micrograms per 100 square centimeters, the decontamination approach will be re-evaluated, and modifications implemented. If the demonstration samples indicate that the decontamination methods are adequate, then the detergent, pressure washing/brushing, and triple rinse approach will be used for the duration of the project. A summary of the field demonstration test will be provided to the EPA (TSCA and RCRA points of contact) in e-mail correspondence that includes: (1) a list of the equipment sampled; (2) a summary of decontamination procedures and wipe sampling protocol; and (3) the wipe sample results. The results of the field demonstration test will also be included in the Final Report submitted to PADEP and the EPA's RCRA project manager.

Equipment and materials (e.g., excavators, loaders, dump trucks, hand-tools) that contact impacted soil will be decontaminated before handling clean materials and before being demobilized from the Site. Liquid materials, such as decontamination water (and other residual material collected during equipment decontamination) will be containerized and transported to an industrial wastewater treatment facility for treatment/discharge. Solid waste material generated during equipment decontamination will be consolidated underneath the capping system or collected, characterized, and disposed of at a facility permitted to accept the material.

C. Institutional Controls

Institutional controls consisting of an environmental covenant, deed restriction, deed notification and post-remediation care plan will be developed to address residual impacts remaining after the completion of the redevelopment activities. The environmental covenant will: (1) restrict future use to non-residential purposes due

to residual impacts onsite other than PCBs; (2) identify the presence of constituents remaining in subsurface soil (below the cap) and in groundwater at the Site; (3) prohibit the use of groundwater at the Site; and (4) require compliance with the Post-Remediation Care Plan. In accordance with 40 CFR 761.61(a)(8), a notation on the deed will indicate that: (1) the land has been used for PCB remediation waste disposal; (2) a cap is in-place and must be maintained in compliance with the Post-Remediation Care Plan; and (3) PCB concentrations greater than 1 ppm and less than 10 ppm remain onsite below the cap. A certification, signed by the property owner, will indicate that the deed notification has been recorded in accordance with 40 CFR 761.61(a)(8)(i)(A). Once signed, the certification will be submitted to the EPA Regional Administrator.

The Post-Remediation Care Plan will: (1) address possible future disturbances of certain soil (to minimize intrusive subsurface activities without appropriate controls and measures); (2) identify known locations of constituents in soil at the Site; (3) set forth the inspection and maintenance activities for capping materials; (4) document and record where and when the inspection and maintenance of engineering controls are being conducted; and (5) report inspection/maintenance results to the PADEP as provided in the environmental covenant.

IV. Summary / Conclusions

The remedial approach for the Historical Tar Plains/Fill Area is consistent with the regulatory requirements for addressing historical PCB releases under the self-implementing PCB remediation waste option contained in 40 CFR 761.61(a), except for the deviations noted above. Considering the existing and future site conditions and the low levels of impact, the proposed self-implementing cleanup and institutional controls will be protective of human health and meet the cleanup objectives for high-occupancy use. We request that the EPA review this notification and respond with any comments or questions.

On behalf of the PCC, Arcadis appreciates your efforts in reviewing this self-implementing cleanup notification and alternate decontamination approval request. Please do not hesitate to contact me at 315.671.9441 or by email at John.Brussel@arcadis.com if you have any questions or need additional information.

Sincerely,
Arcadis U.S., Inc.

Notes:
1. Samples prior to 2019 were collected by Paulus, Sokolowski, and Sartor Engineering, PC on the dates indicated. Samples in 2019 were collected by Arcadis on the dates indicated.
2. Sample depth is reported in feet below ground surface.
3. 2003 and 2005 samples were analyzed by Hampton-Clarke, Veritech Laboratories of Fairfield, New Jersey.
4. 2019 samples were analyzed by SGS North America Incorporated Laboratories of Dayton, New Jersey.
5. Samples were submitted for laboratory analysis for Polychlorinated biphenyls (PCBs) using USEPA SW-846 Method 8082.
6. < = constituent not detected at a concentration above the reported detection limit. These results are also reported in gray.
7. Concentrations reported in milligrams per kilogram (mg/kg) or parts per million (ppm).
8. Brackets indicate the reported concentration of a duplicate sample.
9. Data from 2019 have undergone a Tier II validation. Data prior to 2019 have not been validated.

TSCA PCB Evaluation Summary and Follow-up Correspondence

TSCA PCB EVALUATION SUMMARY

TSCA PCB Evaluation Summary
Remedial Investigation
Philadelphia Coke Co., Inc. Site
Philadelphia, Pennsylvania

This document evaluates whether polychlorinated biphenyls (PCBs) identified in soil at the Philadelphia Coke Co., Inc. site (the Site) by previous environmental investigations are regulated under the Toxic Substances Control Act (TSCA) presented in Title 40 of the Code of Federal Regulation (40 CFR) Part 761. As explained below, PCBs identified in soil samples collected at the Site are related to pre-April 1978 release(s) and the concentrations are therefore not regulated under TSCA.

A brief history of the TSCA regulations and historical Site use are presented below, followed by a soil sampling summary and evaluation of the PCB soil analytical data.

TSCA Regulations Summary and Site History

PCBs were commercially manufactured in the United States from approximately 1930 until 1979, when their production was banned under the TSCA regulations found in 40 CFR Part 761. As defined in 40 CFR Part 761.3, soil that contains PCBs (based on in-place sampling prior to excavation) at a concentration less than 50 parts per million (ppm) as the result of a release that occurred before the effective date of the TSCA regulations (April 1978) is not regulated under TSCA.

Site operations began in the 1920s with a manufactured gas plant (MGP) producing gas for the City of Philadelphia for heating or lighting. Metallurgical coke production replaced the MGP operation and continued until 1982, encompassing all but the easternmost section of the Site (i.e., 2.5 acres east of the existing utility corridor). PCBs were not a raw material, product, or byproduct of either MGP or coking operations. Although historical facility mapping shows an electrical substation building in the west-central portion of the Site, aerial photos do not show electrical equipment outside of the building. There are no known or suspected releases from equipment inside the electrical substation building. All but the easternmost section of the Site has not been used since 1982. This means that there was only a four-year period of operations where PCB releases at most of the Site could be regulated under TSCA.

Fuel blending operations were performed in the easternmost section of the Site for a 20-year period from 1969 to 1989 and consisted of storing/blending #2 and #6 fuel oils brought to the Site by barge and subsequently distributing the oil locally by tanker truck. The fuel blending operation, like the MGP and coking operations, did not use or produce PCBs.

PCB Soil Sampling Summary

As part of previous Remedial Investigations at the Site, a total of 177 soil samples have been collected from 89 sampling locations distributed across the Site and analyzed for PCBs. The analytical results are summarized as follows:

- PCBs were not identified in any of the samples at concentrations greater than 50 ppm.
- PCBs concentrations identified in the samples are well-below Pennsylvania Department of Environmental Protection (PADEP) medium-specific concentrations for soil (i.e., 20 ppm to 770 ppm, depending on Aroclor).
- The highest total PCB concentration detected was 13 ppm (in a sample collected at the northwestern corner of the Site near the intersection of Richmond Street and Buckius Street). This was the only location where PCBs were detected at a concentration greater than 10 ppm.

- PCBs were detected at concentrations greater than 1 ppm in only 11 of the 89 sampling locations.

The Site layout and soil sampling locations where PCBs have been identified at concentrations greater than 1 ppm are shown on Figure 1. The soil analytical results for total PCBs are presented in Table 1. PCB soil analytical results greater than 1 ppm and corresponding sampling locations/depths are summarized in Table 2 along with an evaluation of the data, consistent with that presented below.

PCB Soil Data Evaluation

The PCB soil analytical data are evaluated by area of the Site; as explained below, it is highly unlikely that PCBs at the Site are related to a post-1978 release.

- ***Northern Portion of Site (Historical Coal and Coke Storage Areas):*** As shown on Figure 1, PCBs have been identified at concentrations >1 ppm in four sampling locations in this area (PSSTP-01/01R, PSSTP-02, PCTP-73/73R, and PSSTP-04/04R). These locations are within the footprint of former coal and coke piles that are visible on aerial photographs starting in 1929 until at least 1981 (refer to Attachment 1 for the aerial photographs). Aerial photographs show that the coke storage area footprint covered sampling locations PSSTP-02 and PCTP-73/73R as early as 1929. Aerial photographs by the 1950s show that the coke storage area footprint had expanded westward to the edge of a building located on Richmond Street (extending over sampling location PSSTP-01/01R) and the coal storage area footprint had expanded eastward to the existing utility corridor (extending over sampling location PSSTP-04/04R). It is highly unlikely that PCBs in the coal and coke storage areas could be related to a post-1978 release given that the last available aerial photograph before the end of coke production (which is dated 1981) shows site conditions consistent with earlier photos, in which the coal and coke piles consistently covered these sampling locations. Given that the coal and coke piles covered the areas where PCBs were detected for several years after 1978, these dectections are not TSCA-regulated. PCBs in this area are likely related to historic fill but not Site-related releases post-1978.
- ***Eastern Part of Site Near Philadelphia Beltway Railroad:*** PCBs have been identified at a concentration >1 ppm in only one sampling location in this area of the Site (PCSB-56). This sampling location is between the existing railroad tracks and a utility corridor, outside the former dikes surrounding the two southernmost tanks of the former fuel blending area. PCBs were not detected above 1 ppm in soil samples collected from nearby sampling locations within the former fuel blending area, indicating that PCBs at location PCSB-56 are isolated. Fuel blending operations immediately adjacent to this part of the Site continued until 1989 using #2 and #6 fuel oils (there is no documentation of PCB oil use in this area). Aerial photographs taken between the mid-1960s and 1981 show no development in the immediate vicinity of PCSB-56, and the southernmost tanks of the fuel blending area appear to have been removed by 1988. PCBs in this area are likely related to historic fill or nearby railroad operations but not Site-related releases post-1978.
- ***Southeast Corner of Site – Historical Tar Plains/Fill Area:*** PCBs have been identified at a concentration >1 ppm in four sampling locations in this area of the Site (PSSTP-08, PSSTP-09, PSSTP-19, and PCTP-61). Soil and debris were removed from this area to an average depth of approximately 11 feet during excavation as part of Resource Conservation and Recycling Act (RCRA) closure between 1982 and 1988. Approval to backfill was provided in 1989 by the agency preceding PADEP. The samples from this area that contained PCBs at concentrations >1 ppm were collected during the 2005/2006 Remedial Investigation at depths of 6-7 feet, which would be within the area where fill was placed to backfill the excavations. Therefore, PCBs in this area are attributed to regrading of historic fill at the site to remove the depressions formed by the RCRA soil excavations.

The random and low levels of PCBs identified in soil across this area (and the Site as a whole), both spatially and at various depths, are also indicative of historic fill grading and not a historic point-source release.

West-Central Portion of Site – Near Former Facilities and Buildings: PCBs have been identified at a concentration >1 ppm in two sampling locations in this area of the Site (PCTP-68 and PCTP-69), as indicated below.

- *PCTP-68:* PCBs were detected at a concentration of 1.9 ppm in a subsurface soil sample collected at a depth of 6 feet below ground surface at sampling location PCTP-68, within a concrete driveway approximately 50 feet southwest of a former electrical substation building that housed electrical equipment indoors. However, PCBs were not detected above laboratory detection limits in surface soil at this location or other surface soil sampling locations around this area. The data suggest that PCBs at this location were unrelated to a release from the ground surface in this area. Since development in this area occurred before 1978, the limited PCB presence in the subsurface would also have occurred before 1978.
- *PCTP-69:* PCBs were detected at a concentration of 1.3 ppm in surface soil at sampling location PCTP-68, which is below a former concrete pad associated with a scale house that was constructed before 1978. Since this area was capped with concrete before 1978, the limited PCB presence in the subsurface would also have occurred before 1978.

PCBs in this area are likely related to historic fill but not Site-related releases post-1978.

Notes:

1. Samples prior to 2019 were collected by Paulus, Sokolowski, and Sartor Engineering, PC on the dates indicated. Samples in 2019 were collected by Arcadis on the dates indicated.
2. Sample depth is reported in feet below ground surface.
3. 2003 and 2005 samples were analyzed by Hampton-Clarke, Veritech Laboratories of Fairfield, New Jersey.
4. 2019 samples were analyzed by SGS North America Incorporated Laboratories of Dayton, New Jersey.
5. Samples were analzed for polychlorinated biphenyls (PCBs) using USEPA SW-846 Method 8082.
6. < = No PCB Aroclors detected at a concentration above the reported detection limit. These results are also reported in gray.
7. Concentrations reported in milligrams per kilogram (mg/kg) or parts per million (ppm).
8. Brackets indicate the reported concentration of a duplicate sample.
9. Data from 2019 have undergone a Tier II validation. Data prior to 2019 have not been validated.

Table 2
Evaluation of TSCA PCB Regulations Applicability

Former Philadelphia Coke Co., Inc. Site
Philadelphia, Pennsylvania

Sample Locations with PCBs >1 ppm	General Area	Sample Date	Sample Depth (feet)	Total PCBs (ppm)	Location-Specific Rationale that TSCA Does Not Apply
Northern Portion of Site - Historical Coal and Coke Storage Areas *(these sampling locations are all along/near the northern property boundary that extends along Buckius Street)*					
PSSTP-01	~200 feet east of Richmond Street	3/11/03	1-2	0.08	Polychlorinated biphenyls (PCBs) were commercially manufactured in the United States from approximately 1930 until 1979, when their production was banned under the Toxic Substances Control Act (TSCA) regulations found in Title 40 of the Code of Federal Regulation (40CFR) Part 761. PCBs are not a byproduct of coking operations. As defined in 40 CFR Part 761.3, soil that contains PCBs (based on in-place sampling prior to excavation) at a concentration less than 50 parts per million (ppm) as the result of a release that occurred prior to the effective date of the TSCA regulations (1978) is not regulated under TSCA. PCBs were not identified in soil within this area (and the overall Site) at concentrations greater than 50 ppm. PCB concentrations in soil within this area are relatively low (generally around 1 ppm or less) with one result >10 ppm. The PCB concentrations in soil in this area are well-below those outlined in Pennsylvania Department of Environmental Protection (PADEP) medium-specific concentrations for soil. In general, low-level PCBs are widespread, but random, in soil across this area and found at various depths. This is not indicative of a historic point-source release, but may be related to grading of historic fill. PCBs have been identified at concentrations >1 ppm in four sampling locations in this area. These locations are within the footprint of former coal piles that are visible on aerial photographs from 1929 until at least 1981. Aerial photographs show that the coke storage area footprint covered sampling locations PSSTP-02 and PCTP-73/73R as early as 1929. Aerial photographs by the 1950s show that the coke storage area footprint had expanded westward to the edge of a building located on Richmond Street (extending over sampling location PSSTP-01/01R) and the coal storage area footprint had expanded eastward to the existing utility corridor (extending over sampling location PSSTP-04/04R). It is highly unlikely that PCBs in the coal and coke storage areas would be related to a post-1978 release given that the last aerial photograph before the end of coke production (which is dated 1981) shows site conditions consistent with earlier photos in which the coal and coke piles consistently covered these sampling locations. Given that the coal and coke piles covered the areas where PCBs were detected for sevral years after 1978, these detections are not TSCA regulated.

Eastern Part of Site Near Philadelphia Beltway Railroad					
PCSB-56	~30 feet west of railroad	8/15/2005	0.5	1.7	Soil boring PCSB-56 was drilled between the existing railroad tracks and a utility corridor, outside the former dikes surrounding the two southernmost tanks of the former fuel blending area. PCBs were not detected above 1 ppm in soil samples collected from nearby sampling locations within the former fuel blending area, indicating that PCBs at location PCSB-56 are isolated. Fuel blending operations immediately adjacent to this part of the site continued until 1989 and used No. 2 and No. 6 fuel oil brought in by barge (no documentation of PCB oil use in this area). Aerial photographs taken between the mid-1960s and 1981 show no development in the immediate vicinity of PCSB-56, and the southernmost tanks of the fuel blending area appear to have been removed by 1988. PCBs in this area are likely related to historical fill or nearby railroad operations, but not Site-related releases post 1978.

Table 2
Evaluation of TSCA PCB Regulations Applicability

Former Philadelphia Coke Co., Inc. Site
Philadelphia, Pennsylvania

Sample Locations with PCBs >1 ppm	General Area	Sample Date	Sample Depth (feet)	Total PCBs (ppm)	Location-Specific Rationale that TSCA Does Not Apply
Southeast Corner of Site - Historical Tar Plains/Fill Area					
PSSTP-19	~230 feet west of utility corridor	3/12/03	1-2	0.23	These four former test pits were excavated within the historical tar plains/fill area. Soil and debris were removed from this area to an average depth of approximately 11 feet during excavation as part of Resource Conservation and Recycling Act (RCRA) closure between 1982 and 1988. Approval to backfill was provided in 1989 by the agency preceding PADEP. The samples from this area that contained PCBs at concentrations >1 ppm were collected during the 2005/2006 Remedial Investigation at depths of 6-7 feet, which would be within or near the bottom of the fill placed to backfill the excavations. Therefore, PCBs in this area are attributed to regrading of historic fill at the site to remove the depressions formed by the RCRA soil excavations. The random and low levels of PCBs identified in soil across this area (and the site as a whole), both spatially and at various depths, are also indicative of historic fill grading and not a historic point-source release.
			7-8	1.08	
PSSTP-08	~185 feet west of southeast corner of site	3/11/03	1-2	0.12	
			6-7	1.2	
PSSTP-09	~250 feet west of southeast corner of site	3/12/03	1-2	0.05	
			6-7	8.9	
PCTP-61	~450 feet west of southeast corner of site	9/8/05	0.5	1.3 [0.54]	
			7.5	< 0.027	
West-Central Portion of Site - Near Former Facilities and Buildings					
PCTP-68	~145 feet northeast of the LeFevre & Garden Street intersection	9/9/05	0.5	<0.018	PCBs have been identified at a concentration >1 ppm in two sampling locations in this area of the Site (PCTP-68 and PCTP-69), as indicated below. - *PCTP-68:* PCBs were detected at a concentration of 1.9 ppm in a subsurface soil sample collected at a depth of 6 feet below ground surface at sampling location PCTP-68, adjacent to a former electrical substation building that housed electrical equipment indoors. However, PCBs were not detected above laboratory detection limits in surface soil at this location or other surface soil sampling locations around this area. The data suggest that PCBs at this location were unrelated to a release from the ground surface in this area. Since development in this area occurred before 1978, the limited PCB presence in the subsurface would also have occurred before 1978. - *PCTP-69:* PCBs were detected at a concentration of 1.3 ppm in surface soil at sampling location PCTP-68, which is below a former concrete pad associated with a scale house that was constructed before 1978. Since this area was capped with concrete before 1978, the limited PCB presence in the subsurface would also have occurred before 1978. PCBs in this area are likely related to historical fill but not Site-related releases post-1978.

EPA RESPONSE TO TSCA PCB EVALUATION

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION III
1650 Arch Street
Philadelphia, Pennsylvania 19103-2029
July 8, 2021

VIA Email

John C. Brussel, P.E.
Principal Engineer/Certified Project Manager
Arcadis of New York, Inc.
One Lincoln Center, 110 West Fayette Street, Suite 300
Syracuse, NY 13202

Re: TSCA PCB Evaluation Summary
Philadelphia Coke Co., Inc. Site

Dear Mr. Brussel,

The U.S. Environmental Protection Agency (EPA) has received and reviewed the TSCA PCB Evaluation Summary for soil at the Philadelphia Coke Site submitted via email on May 12, 2021 on behalf of National Grid. In conclusion, it was proposed that the Polychlorinated Biphenyls (PCBs) identified in soil samples collected at the Site are related to pre-1978 releases and are not regulated under the Toxic Substances Control Act (TSCA).

EPA does not agree with the conclusion that soils in the Southeastern Corner of the Site – Historic Tar Plains/Fill Area are related to pre-1978 releases. This is due to the fact that samples collected in 2005/2006 containing PCBs >1 ppm were related to backfilling activities that occurred in 1989 which constitutes a release under TSCA. Therefore, PCB releases to soils in this area are subject to TSCA regulations. EPA requests that National Grid prepare and submit a cleanup proposal in accordance with 40 C.F.R. 761.61.

EPA does agree with the conclusion that the soils in the remaining areas evaluated (Northern Portion of the Site (Historical Coke and Coal Storage Area), Eastern Part of the Site near Philadelphia Beltway Railroad, and West-Central Portion of Site – Near Former Facilities and Buildings) are related to pre-1978 releases and are not regulated under TSCA. PCB concentrations in these areas should be addressed in conjunction with the cleanup activities being performed under the One Cleanup Program.

Please contact me at (215) 814-2796 or bilash.kevin@epa.gov if you have any questions or concerns.

Sincerely,

_____

Kevin Bilash, Remedial Project Manager
Land, Chemicals and Redevelopment Division
U.S. EPA Region III

Healy, Lawrence

Attachments: EPA PCB eval response 7_8_21.pdf

Categories: Business

Good morning John,

Thank you for the follow up and patience while going through this evaluation in coordination with my TSCA contact.
I have attached EPA's response to the TSCA PCB Evaluation Summary for the Philadelphia Coke Site submitted on May 12, 2021.
As you correctly summarized, EPA agrees that PCB releases were pre-1978 except in the southeast corner.

Regarding the capping and covenant proposal in the southeast corner, I have no initial concerns and think that is an acceptable plan.
As you know though, TSCA is not the primary Act I work under and you will see in the letter a request to prepare and submit a cleanup proposal in accordance with 40 C.F.R. 761.61.
I will look into it further and discuss the proposed cleanup with my coordinator but suggest to review 40 C.F.R. 761.61 and make sure you meet the requirements.
My thoughts are mostly related to assuring you meet the "cap" requirements as they may be different than what I'd expect under RCRA or Act 2.
Thinking forward, I am ok if you submit the cleanup proposal under separate cover when you are ready to submit the Act 2 cleanup plan unless you prefer to do so earlier.
In the meantime I will let you know any comments received from discussing this with my TSCA coordinator.

If you have any questions or concerns about the letter or contents of this email, please let me know.

Thank you,
Kevin Bilash

Subject: Question for Kevin - For EPA Review: TSCA PCB Evaluation - Philadelphia Coke Site, 4501 Richmond Street, Philadelphia, PA (eFACTS PF No. 831308)

Kevin,

As a follow-up to the voice-mail message I left you yesterday afternoon, we wanted to check with you on the status of the letter you mentioned during our June 16, 2021 Teams meeting regarding the TSCA PCB evaluation for the Philadelphia Coke site and EPA's position.

Per our discussions during the call, we understand EPA agrees that PCB releases were pre-1978, except in the southeast corner of the site near the former tar plains, where soil excavation was performed as part of the RCRA corrective action in the 1988-1993 timeframe.

You had mentioned that the PCBs in soil within the southeast corner could be addressed via Covenants and Restrictions, with no further excavation or capping necessary provided that this area is designated "low occupancy" (PCBs <25 ppm).

As indicated in the call and confirmed in follow-up discussion with the developer, they are planning to cap the entire southeast corner of the site (concrete, asphalt, 2-feet of clean soil) as part of their redevelopment and have an environmental covenant as part of the overall pathway elimination cleanup approach. This planned approach would allow a "high occupancy" area designation (with PCBs >1 and <10 ppm below the cap) for the southeast corner of the site and support potential future land conveyance and public uses associated with the Delaware Avenue extension and railroad relocation in this area.

Feel free to call Brian Stearns of National Grid (315.461.7892), Dan Sheehan of Arcadis (302.884.6919), or me (315.671.9441) if you have any questions or need additional information.

Thank you.

John

Good afternoon John,

We have and I received a first round of comments from the PCB coordinator which prompted additional questions from me back to TSCA.
I expect a response from them soon, likely by the end of this week. I will then prepare the EPA response.
Let's set up a call for next week to discuss the findings prior to our official response. Currently, I have availability Tuesday AM or all day Wednesday.

Thank you,

Kevin,

Good morning. We were wondering if you had a chance to review the TSCA PCB Evaluation summary yet.

Please let us know if you agree with the conclusions or have any questions.

Thank you.

John

John,

I just wanted to let you know I am going to start reviewing this information now. I have not forgotten about it or missed your email.
Coincidentally, over the last month+ there was an internal national PCB training that just occurred that I attended so I thought it prudent to have the latest up to date info before assessing your submittal.

Thank you,

Kevin,

On behalf of National Grid and as a follow-up to the virtual meeting that you, Dan Sheehan, and I had on April 2, 2021, please find the attached "TSCA PCB Evaluation Summary" for soil at the Philadelphia Coke Site, including the tables, figure, and historical aerial photographs that we previewed during the meeting.

As explained in the summary, the PCBs identified in soil samples collected at the Site are related to pre-1978 release(s) and the concentrations are therefore not regulated under TSCA.

Please review the attached and let us know if EPA concurs with our conclusion.

Feel free to call Dan Sheehan (our PA engineer-of-record for the project) at 302.884.6919 or me at 315.671.9441 if you have any questions or need additional information.

Thank you.

John

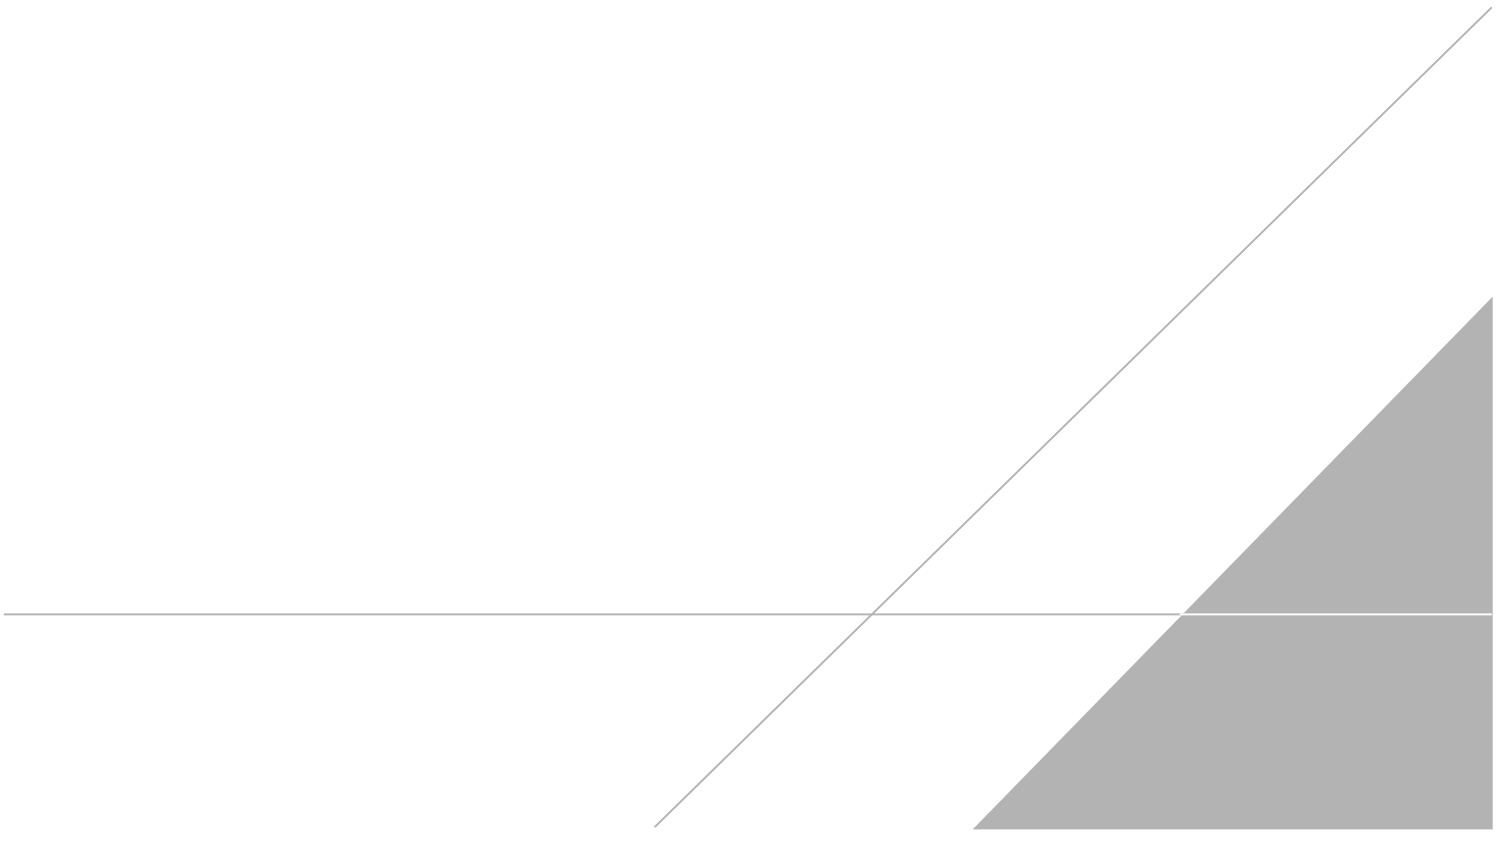
Threatened and Endangered Species Consultation Correspondence

PNDI Final Receipt #628950: Former Philadelphia Coke Plant Site



1. PROJECT INFORMATION

Project Name: **Former Philadelphia Coke Plant Site**
Date of Review: **10/2/2019 10:40:47 AM**
Project Category: **Hazardous Waste Clean-up, Site Remediation, and Reclamation, Spill (e.g., oil, chemical)**
Project Area: **64.82 acres**
County(s): **Philadelphia**
Township/Municipality(s): **PHILADELPHIA**
ZIP Code: **19137**
Quadrangle Name(s): **CAMDEN**
Watersheds HUC 8: **Lower Delaware**
Watersheds HUC 12: **Pompeston Creek-Delaware River; Tacony Creek-Frankford Creek**
Decimal Degrees: **39.995443, -75.068641**
Degrees Minutes Seconds: **39° 59' 43.5965" N, 75° 4' 7.1084" W**

2. SEARCH RESULTS

Agency	Results	Response
PA Game Commission	No Known Impact	No Further Review Required
PA Department of Conservation and Natural Resources	No Known Impact	No Further Review Required
PA Fish and Boat Commission	**Potential Impact**	**FURTHER REVIEW IS REQUIRED, See Agency Response**
U.S. Fish and Wildlife Service	No Known Impact	No Further Review Required

As summarized above, Pennsylvania Natural Diversity Inventory (PNDI) records indicate there may be potential impacts to threatened and endangered and/or special concern species and resources within the project area. If the response above indicates "No Further Review Required" no additional communication with the respective agency is required. If the response is "Further Review Required" or "See Agency Response," refer to the appropriate agency comments below. Please see the DEP Information Section of this receipt if a PA Department of Environmental Protection Permit is required.

RESPONSE TO QUESTION(S) ASKED

Q1: Aquatic habitat (stream, river, lake, pond, etc.) is located on or adjacent to the subject property and project activities (including discharge) may occur within 300 feet of these habitats?
Your answer is: Yes

3. AGENCY COMMENTS

Regardless of whether a DEP permit is necessary for this proposed project, any potential impacts to threatened and endangered species and/or special concern species and resources must be resolved with the appropriate jurisdictional agency. In some cases, a permit or authorization from the jurisdictional agency may be needed if adverse impacts to these species and habitats cannot be avoided.

These agency determinations and responses are **valid for two years** (from the date of the review), and are based on the project information that was provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the following change: 1) project location, 2) project size or configuration, 3) project type, or 4) responses to the questions that were asked during the online review, the results of this review are not valid, and the review must be searched again via the PNDI Environmental Review Tool and resubmitted to the jurisdictional agencies. The PNDI tool is a primary screening tool, and a desktop review may reveal more or fewer impacts than what is listed on this PNDI receipt. The jursidictional agencies **strongly advise against** conducting surveys for the species listed on the receipt prior to consultation with the agencies.

PA Game Commission
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Department of Conservation and Natural Resources
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Fish and Boat Commission
RESPONSE:
Further review of this project is necessary to resolve the potential impact(s). Please send project information to this agency for review (see WHAT TO SEND).

PFBC Species: (Note: The Pennsylvania Conservation Explorer tool is a primary screening tool, and a desktop review may reveal more or fewer species than what is listed below.)

Scientific Name	Common Name	Current Status
Sensitive Species**		Endangered
Sensitive Species**		Endangered
Sensitive Species**		Threatened

U.S. Fish and Wildlife Service
RESPONSE:
No impacts to **federally** listed or proposed species are anticipated. Therefore, no further consultation/coordination under the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq. is required. Because no take of federally listed species is anticipated, none is authorized. This response does not reflect potential Fish and Wildlife Service concerns under the Fish and Wildlife Coordination Act or other authorities.

* Special Concern Species or Resource - Plant or animal species classified as rare, tentatively undetermined or candidate as well as other taxa of conservation concern, significant natural communities, special concern populations (plants or animals) and unique geologic features.
** Sensitive Species - Species identified by the jurisdictional agency as collectible, having economic value, or being susceptible to decline as a result of visitation.

WHAT TO SEND TO JURISDICTIONAL AGENCIES

If project information was requested by one or more of the agencies above, upload* or email* the following information to the agency(s). Instructions for uploading project materials can be found here. This option provides the applicant with the convenience of sending project materials to a single location accessible to all three state agencies. Alternatively, applicants may email or mail their project materials (see AGENCY CONTACT INFORMATION).
***Note:** U.S.Fish and Wildlife Service requires applicants to mail project materials to the USFWS PA field office (see AGENCY CONTACT INFORMATION). USFWS will not accept project materials submitted electronically (by upload or email).

Check-list of Minimum Materials to be submitted:
____Project narrative with a description of the overall project, the work to be performed, current physical characteristics of the site and acreage to be impacted.
____A map with the project boundary and/or a basic site plan(particularly showing the relationship of the project to the physical features such as wetlands, streams, ponds, rock outcrops, etc.)
In addition to the materials listed above, USFWS REQUIRES the following
____**SIGNED** copy of a Final Project Environmental Review Receipt

The inclusion of the following information may expedite the review process.
____Color photos keyed to the basic site plan (i.e. showing on the site plan where and in what direction each photo was taken and the date of the photos)
____Information about the presence and location of wetlands in the project area, and how this was determined (e.g., by a qualified wetlands biologist), if wetlands are present in the project area, provide project plans showing the location of all project features, as well as wetlands and streams.

4. DEP INFORMATION

The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

5. ADDITIONAL INFORMATION

The PNDI environmental review website is a preliminary screening tool. There are often delays in updating species status classifications. Because the proposed status represents the best available information regarding the conservation status of the species, state jurisdictional agency staff give the proposed statuses at least the same consideration as the current legal status. If surveys or further information reveal that a threatened and endangered and/or special concern species and resources exist in your project area, contact the appropriate jurisdictional agency/agencies immediately to identify and resolve any impacts.

For a list of species known to occur in the county where your project is located, please see the species lists by county found on the PA Natural Heritage Program (PNHP) home page (www.naturalheritage.state.pa.us). Also note that the PNDI Environmental Review Tool only contains information about species occurrences that have actually been reported to the PNHP.

Introduction

This Conservation Planning Report compiles names, descriptions, maps, locations, measurements, links and references for Natural Heritage Areas (core and supporting habitats), Important Bird Areas, State Lands, and agency designated water resources that are coincident with an area of interest defined by the user of the Pennsylvania Conservation Explorer tool. For an overview and additional details, please be sure to visit the website at www.naturalheritage.state.pa.us and download the applicable County Natural Heritage Inventory report(s).

Natural Heritage Areas

Natural Heritage Areas (NHAs) are sites that have been identified as critical habitat for species or natural communities of concern. This dataset is designed to identify, map and discuss areas that support species of concern, exemplary natural communities, and broad expanses of intact natural ecosystems that support components of Pennsylvanias native species biodiversity. These areas are prioritized based upon their ecological qualities and provided with recommendations regarding their management and protection. Most of the existing NHAs have been developed through PNHPs County Natural Heritage Inventories -- systematic studies of the critical biological resources of a county.

Natural Heritage Site Name	Description	Reference
Delaware River Shoreline	The species of concern noted within this site are only found in specific areas where tidal habitat remains protected and in a few of the more naturally managed park areas.	Link

Local Parks

A local park is a publicly owned and publicly accessible park or natural area that engages participants of all ages in outdoor recreational experiences. Local parks and open spaces connect citizens to close-to-home outdoor recreation opportunities for play and physical activities; promote health and wellness, and environmental stewardship.

Local Park	Park Type	County	State or Federal Grant Funding
Bridesburg Recreation Center	Neighborhood Parks	Philadelphia	Yes, click here for more information

For additional information about the Pennsylvania Natural Heritage Program, visit the website at www.naturalheritage.state.pa.us or you can email your questions and comments to RA-HeritageReview@pa.gov.

1. PROJECT INFORMATION

Project Name: **Former Philadelphia Coke Plant Site**
Date of Review: **4/26/2017 01:27:38 PM**

RESPONSE TO QUESTION(S) ASKED

Q1: Aquatic habitat (stream, river, lake, pond, etc.) is located on or adjacent to the subject property and project activities (including discharge) may occur within 300 feet of these habitats?
Your answer is: Yes

3. AGENCY COMMENTS

Regardless of whether a DEP permit is necessary for this proposed project, any potential impacts to threatened and endangered species and/or special concern species and resources must be resolved with the appropriate jurisdictional agency. In some cases, a permit or authorization from the jurisdictional agency may be needed if adverse impacts to these species and habitats cannot be avoided.

These agency determinations and responses are **valid for two years** (from the date of the review), and are based on the project information that was provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the following change: 1) project location, 2) project size or configuration, 3) project type, or 4) responses to the questions that were asked during the online review, the results of this review are not valid, and the review must be searched again via the PNDI Environmental Review Tool and resubmitted to the jurisdictional agencies. The PNDI tool is a primary screening tool, and a desktop review may reveal more or fewer impacts than what is listed on this PNDI receipt. The jursidictional agencies **strongly advise against** conducting surveys for the species listed on the receipt prior to consultation with the agencies.

PA Game Commission
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Department of Conservation and Natural Resources
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Fish and Boat Commission
RESPONSE:
Further review of this project is necessary to resolve the potential impact(s). Please send project information to this agency for review (see WHAT TO SEND).

PFBC Species: (Note: The Pennsylvania Conservation Explorer tool is a primary screening tool, and a desktop review may reveal more or fewer species than what is listed below.)

Scientific Name	Common Name	Current Status
Sensitive Species**		Endangered
Sensitive Species**		Endangered
Sensitive Species**		Threatened

U.S. Fish and Wildlife Service
RESPONSE:
No impacts to **federally** listed or proposed species are anticipated. Therefore, no further consultation/coordination under the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq. is required. Because no take of federally listed species is anticipated, none is authorized. This response does not reflect potential Fish and Wildlife Service concerns under the Fish and Wildlife Coordination Act or other authorities.

DRAFT NOT FOR ACTUAL USE

* Special Concern Species or Resource - Plant or animal species classified as rare, tentatively undetermined or candidate as well as other taxa of conservation concern, significant natural communities, special concern populations (plants or animals) and unique geologic features.
** Sensitive Species - Species identified by the jurisdictional agency as collectible, having economic value, or being susceptible to decline as a result of visitation.

WHAT TO SEND TO JURISDICTIONAL AGENCIES

If project information was requested by one or more of the agencies above, upload* or email* the following information to the agency(s). Instructions for uploading project materials can be found here. This option provides the applicant with the convenience of sending project materials to a single location accessible to all three state agencies. Alternatively, applicants may email or mail their project materials (see AGENCY CONTACT INFORMATION).
***Note:** U.S.Fish and Wildlife Service requires applicants to mail project materials to the USFWS PA field office (see AGENCY CONTACT INFORMATION). USFWS will not accept project materials submitted electronically (by upload or email).

Check-list of Minimum Materials to be submitted:
____Project narrative with a description of the overall project, the work to be performed, current physical characteristics of the site and acreage to be impacted.
____A map with the project boundary and/or a basic site plan(particularly showing the relationship of the project to the physical features such as wetlands, streams, ponds, rock outcrops, etc.)
In addition to the materials listed above, USFWS REQUIRES the following
____**SIGNED** copy of a Final Project Environmental Review Receipt

The inclusion of the following information may expedite the review process.
____Color photos keyed to the basic site plan (i.e. showing on the site plan where and in what direction each photo was taken and the date of the photos)
____Information about the presence and location of wetlands in the project area, and how this was determined (e.g., by a qualified wetlands biologist), if wetlands are present in the project area, provide project plans showing the location of all project features, as well as wetlands and streams.

4. DEP INFORMATION

The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

5. ADDITIONAL INFORMATION

The PNDI environmental review website is a preliminary screening tool. There are often delays in updating species status classifications. Because the proposed status represents the best available information regarding the conservation status of the species, state jurisdictional agency staff give the proposed statuses at least the same consideration as the current legal status. If surveys or further information reveal that a threatened and endangered and/or special concern species and resources exist in your project area, contact the appropriate jurisdictional agency/agencies immediately to identify and resolve any impacts.

For a list of species known to occur in the county where your project is located, please see the species lists by county found on the PA Natural Heritage Program (PNHP) home page (www.naturalheritage.state.pa.us). Also note that the PNDI Environmental Review Tool only contains information about species occurrences that have actually been reported to the PNHP.

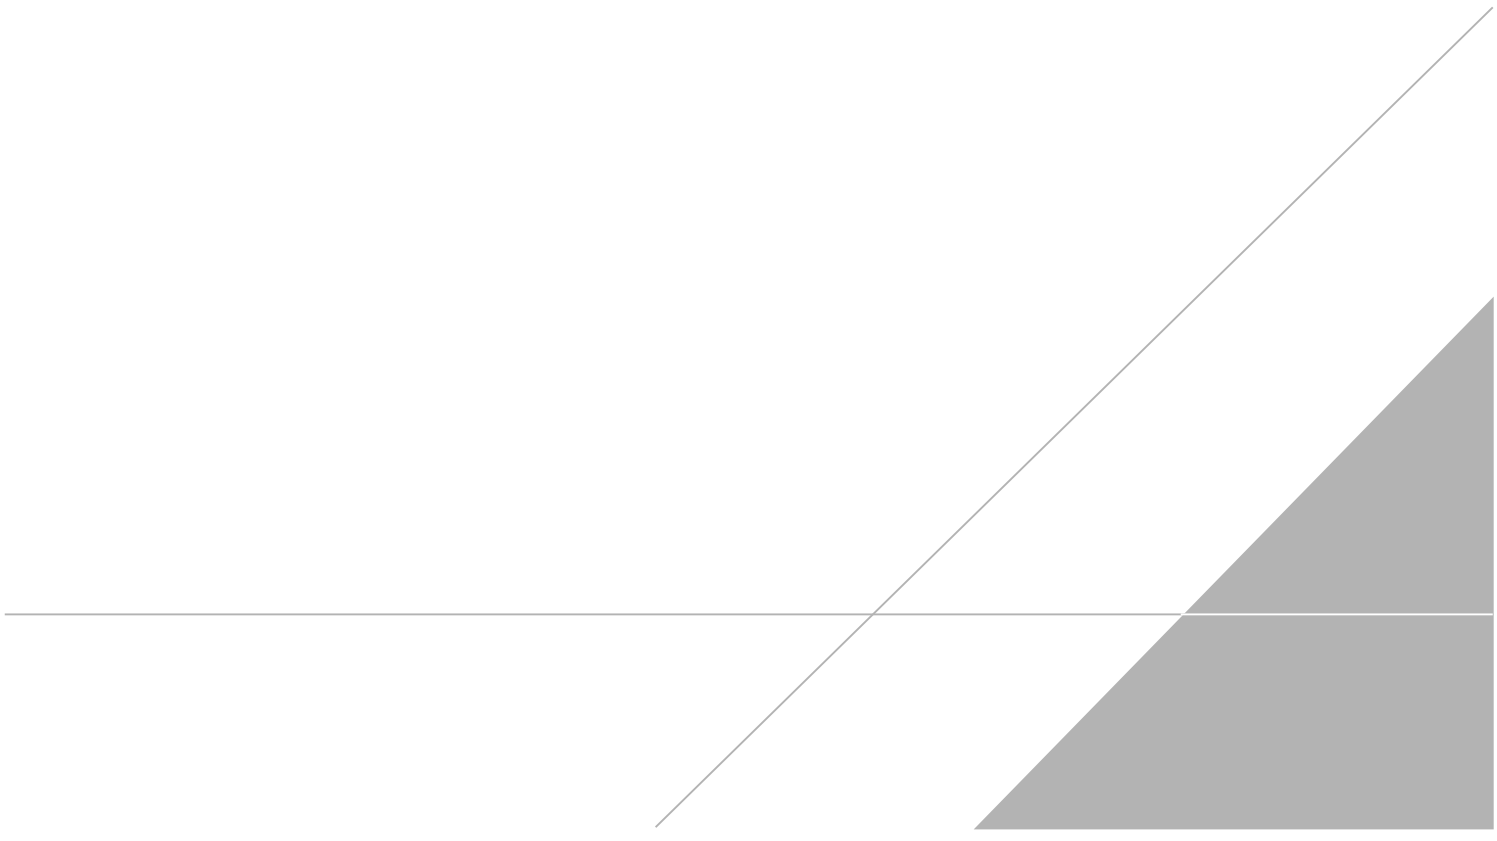
October 1, 2019: Electronic Submittal of Supporting Information for PFBC Review for PDNI Draft Receipt #628950



Proposed Remedial Investigation
National Grid Philadelphia Coke Site, Philadelphia, PA

Project Narrative

Arcadis is proposing a Remedial Investigation (RI) to verify historical sampling results and delineate areas of known impact at the National Grid Philadelphia Coke Site (Philadelphia Coke Co., Inc. facility in Philadelphia, Pennsylvania). This work would support proposed redevelopment activities through the PA Department of Environmental Protection (PADEP) Act 2 Land Recycling Program (Administered in Title 25 Chapter 250 of the Pennsylvania Codes). National Grid will submit a Notice of Intent to Remediate to PADEP prior to performing investigation activities to enter the Act 2 program. Investigation activities will be proposed to PADEP prior to initialization and potentially include:

- Drilling approximately 80 soil borings.
- Excavating approximately 15 test pits.
- Installing 4 new groundwater monitoring wells and 8 new piezometers.
- Analyzing approximately 50 groundwater samples and 110 soil samples for TCL VOCs, TCL SVOCs, TAL inorganics, cyanide, pesticides, and/or PCBs.
- Surveying new and historical sample locations.
- Performing geophysical survey and vacuum excavation for utility clearance at each sampling location.
- Potentially clearing brush and trees as necessary to access proposed sampling locations.

The site is located on Richmond Street between Orthodox Street and Buckius Street in the Bridesburg section of Philadelphia, Pennsylvania. The Delaware River is immediately east of the site. The total site area is approximately 67 acres, with much of this area being accessed for the proposed sampling. Although the site is immediately adjacent to the Delaware River, no in-water work will occur and no off-site disturbances to the river and its habitats and/or environs are anticipated.

The site was developed in the mid-1920s to provide manufactured gas to the City of Philadelphia. Facility operations from January 1929 to May 1982 focused on the production of metallurgical coke and its associated by-products. Principal areas of the operation included coal and coke storage, coke production, tar storage, by-product operations, and iron oxide storage. The site also included an iron oxide waste area and tar plain area. A fuel oil blending facility operated on the eastern 2.5 acres of the site from approximately 1969 through 1989 by Patterson Oil Co. and Eastern Gas Co. All former structures at the site have been demolished to ground level, and the site is currently vacant with some existing foundations and roads occurring.

A description of the natural resources that occur at the site is contained in the Natural Heritage Inventory of Philadelphia County, Pennsylvania (December 2008) for the Delaware River Shoreline on pages 136-137 for the “Between Orthodox and Buckius Streets”. In summary, the site is being reclaimed by a mix of herbaceous and woody vegetation, likely dominated by weedy introduced plant species and early successional native species. The riverfront contains a mix of rubble-armored seawall, dilapidated piers, a narrow sandy/gravel beach, and a small but well-developed tidal marsh.

1. PROJECT INFORMATION

Project Name: **Former Philadelphia Coke Plant Site**
Date of Review: **4/26/2017 01:27:38 PM**
Project Category: **Hazardous Waste Clean-up, Site Remediation, and Reclamation, Spill (e.g., oil, chemical)**
Project Area: **64.82 acres**
County(s): **Philadelphia**
Township/Municipality(s): **PHILADELPHIA**
ZIP Code: **19137**
Quadrangle Name(s): **CAMDEN**
Watersheds HUC 8: **Lower Delaware**
Watersheds HUC 12: **Pompeston Creek-Delaware River; Tacony Creek-Frankford Creek**
Decimal Degrees: **39.995443, -75.068641**
Degrees Minutes Seconds: **39° 59' 43.5965" N, 75° 4' 7.1084" W**

2. SEARCH RESULTS

Agency	Results	Response
PA Game Commission	No Known Impact	No Further Review Required
PA Department of Conservation and Natural Resources	No Known Impact	No Further Review Required
PA Fish and Boat Commission	**Potential Impact**	**FURTHER REVIEW IS REQUIRED, See Agency Response**
U.S. Fish and Wildlife Service	No Known Impact	No Further Review Required

As summarized above, Pennsylvania Natural Diversity Inventory (PNDI) records indicate there may be potential impacts to threatened and endangered and/or special concern species and resources within the project area. If the response above indicates "No Further Review Required" no additional communication with the respective agency is required. If the response is "Further Review Required" or "See Agency Response," refer to the appropriate agency comments below. Please see the DEP Information Section of this receipt if a PA Department of Environmental Protection Permit is required.

RESPONSE TO QUESTION(S) ASKED

Q1: Aquatic habitat (stream, river, lake, pond, etc.) is located on or adjacent to the subject property and project activities (including discharge) may occur within 300 feet of these habitats?
Your answer is: Yes

3. AGENCY COMMENTS

Regardless of whether a DEP permit is necessary for this proposed project, any potential impacts to threatened and endangered species and/or special concern species and resources must be resolved with the appropriate jurisdictional agency. In some cases, a permit or authorization from the jurisdictional agency may be needed if adverse impacts to these species and habitats cannot be avoided.

These agency determinations and responses are **valid for two years** (from the date of the review), and are based on the project information that was provided, including the exact project location; the project type, description, and features; and any responses to questions that were generated during this search. If any of the following change: 1) project location, 2) project size or configuration, 3) project type, or 4) responses to the questions that were asked during the online review, the results of this review are not valid, and the review must be searched again via the PNDI Environmental Review Tool and resubmitted to the jurisdictional agencies. The PNDI tool is a primary screening tool, and a desktop review may reveal more or fewer impacts than what is listed on this PNDI receipt. The jursidictional agencies **strongly advise against** conducting surveys for the species listed on the receipt prior to consultation with the agencies.

PA Game Commission
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Department of Conservation and Natural Resources
RESPONSE:
No Impact is anticipated to threatened and endangered species and/or special concern species and resources.

PA Fish and Boat Commission
RESPONSE:
Further review of this project is necessary to resolve the potential impact(s). Please send project information to this agency for review (see WHAT TO SEND).

PFBC Species: (Note: The Pennsylvania Conservation Explorer tool is a primary screening tool, and a desktop review may reveal more or fewer species than what is listed below.)

Scientific Name	Common Name	Current Status
Sensitive Species**		Endangered
Sensitive Species**		Endangered
Sensitive Species**		Threatened

U.S. Fish and Wildlife Service
RESPONSE:
No impacts to **federally** listed or proposed species are anticipated. Therefore, no further consultation/coordination under the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq. is required. Because no take of federally listed species is anticipated, none is authorized. This response does not reflect potential Fish and Wildlife Service concerns under the Fish and Wildlife Coordination Act or other authorities.

DRAFT NOT FOR ACTUAL USE

* Special Concern Species or Resource - Plant or animal species classified as rare, tentatively undetermined or candidate as well as other taxa of conservation concern, significant natural communities, special concern populations (plants or animals) and unique geologic features.
** Sensitive Species - Species identified by the jurisdictional agency as collectible, having economic value, or being susceptible to decline as a result of visitation.

WHAT TO SEND TO JURISDICTIONAL AGENCIES

If project information was requested by one or more of the agencies above, upload* or email* the following information to the agency(s). Instructions for uploading project materials can be found here. This option provides the applicant with the convenience of sending project materials to a single location accessible to all three state agencies. Alternatively, applicants may email or mail their project materials (see AGENCY CONTACT INFORMATION).
***Note:** U.S.Fish and Wildlife Service requires applicants to mail project materials to the USFWS PA field office (see AGENCY CONTACT INFORMATION). USFWS will not accept project materials submitted electronically (by upload or email).

Check-list of Minimum Materials to be submitted:
____Project narrative with a description of the overall project, the work to be performed, current physical characteristics of the site and acreage to be impacted.
____A map with the project boundary and/or a basic site plan(particularly showing the relationship of the project to the physical features such as wetlands, streams, ponds, rock outcrops, etc.)
In addition to the materials listed above, USFWS REQUIRES the following
____**SIGNED** copy of a Final Project Environmental Review Receipt

The inclusion of the following information may expedite the review process.
____Color photos keyed to the basic site plan (i.e. showing on the site plan where and in what direction each photo was taken and the date of the photos)
____Information about the presence and location of wetlands in the project area, and how this was determined (e.g., by a qualified wetlands biologist), if wetlands are present in the project area, provide project plans showing the location of all project features, as well as wetlands and streams.

4. DEP INFORMATION

The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

5. ADDITIONAL INFORMATION

The PNDI environmental review website is a preliminary screening tool. There are often delays in updating species status classifications. Because the proposed status represents the best available information regarding the conservation status of the species, state jurisdictional agency staff give the proposed statuses at least the same consideration as the current legal status. If surveys or further information reveal that a threatened and endangered and/or special concern species and resources exist in your project area, contact the appropriate jurisdictional agency/agencies immediately to identify and resolve any impacts.

For a list of species known to occur in the county where your project is located, please see the species lists by county found on the PA Natural Heritage Program (PNHP) home page (www.naturalheritage.state.pa.us). Also note that the PNDI Environmental Review Tool only contains information about species occurrences that have actually been reported to the PNHP.

Natural Heritage Areas

Natural Heritage Areas (NHAs) are sites that have been identified as critical habitat for species or natural communities of concern. This dataset is designed to identify, map and discuss areas that support species of concern, exemplary natural communities, and broad expanses of intact natural ecosystems that support components of Pennsylvanias native species biodiversity. These areas are prioritized based upon their ecological qualities and provided with recommendations regarding their management and protection. Most of the existing NHAs have been developed through PNHPs County Natural Heritage Inventories -- systematic studies of the critical biological resources of a county.

Natural Heritage Site Name	Description	Reference
Delaware River Shoreline	The species of concern noted within this site are only found in specific areas where tidal habitat remains protected and in a few of the more naturally managed park areas.	Link

Local Parks

A local park is a publicly owned and publicly accessible park or natural area that engages participants of all ages in outdoor recreational experiences. Local parks and open spaces connect citizens to close-to-home outdoor recreation opportunities for play and physical activities; promote health and wellness, and environmental stewardship.

Local Park	Park Type	County	State or Federal Grant Funding
Bridesburg Recreation Center	Neighborhood Parks	Philadelphia	Yes, click here for more information

For additional information about the Pennsylvania Natural Heritage Program, visit the website at www.naturalheritage.state.pa.us or you can email your questions and comments to RA-HeritageReview@pa.gov.

Most of the area between the I-95 freeway and the Delaware River has been greatly modified from the extensive system of tidal marshes that used to dominate the shoreline. Marshes were drained and filled to provide additional land for the expansion of Philadelphia and its ports. Most of this area is still within the floodplain of the river and is likely to be subject to future flooding from increasingly unpredictable weather patterns. The Delaware River shoreline in Philadelphia currently supports a mix of uses. Formerly, this area was a very active shipping and industrial hub of North America. While still an important entryway for sea freight, much of the riverfront has seen considerable change in the past few decades. Many areas that had been associated with shipping and industry have been demolished, leaving various large and small patches of vacant ground and their associated piers along the riverfront.

Since much of the Delaware River shoreline in Philadelphia is currently transitioning from past industrial and shipping activity, the city is presented with an excellent opportunity to recreate a continuous greenway corridor along this stretch of the river. This strip of land lends itself well to the reestablishment of a ribbon of native vegetation that will help provide habitat for native plants and animals while filtering and trapping runoff from the city before it enters the river. In addition, the linear corridor can function as a portion of a public greenway along the length of the Delaware riverfront. Such a public amenity would greatly improve the quality of life for all residents and visitors to the city. Future developments should be set back from the river shoreline to accommodate a 100-meter wide vegetated riparian buffer between the river's edge and development activity. The shoreline habitat can be improved by removing portions of the armored bulkheads and reconnecting the river to a portion of its natural floodplain. Replanting the riparian area in native trees and shrubs would enhance its ecological value.

The crumbling, paved footprints of past industrial activity are giving way to expanses of early successional vegetation. Vegetation has begun to colonize the unused piers and unpaved portions of the former industrial sites. Where the shoreline vegetation strip widens, it supports trees, shrubs, vines, and herbaceous vegetation between the rubble-armored hardened shoreline and the crumbling pavement of the former industrial sites. Along the periphery of the river, native species of plants and animals compete with introduced species for the limited space and resources available for their use. This disturbed strip of vegetation is frequently dominated by invasive non-native trees such as tree-of-heaven, princess tree, Norway maple, Siberian elm, white poplar, and white mulberry, but also contains native trees including sycamore, silver maple, pin oak, black cherry, hackberry, red maple, honey locust, walnut, red oak, green ash, tulip poplar, black willow, slippery elm, and box elder. Invasive shrubs

and vines frequently dominate the understory, including Japanese honeysuckle, porcelain berry, Asiatic bittersweet, multiflora rose, bush honeysuckles, common privet, barberry, paper mulberry, and autumn olive.

photo source: Rocky Gleason, PNHP

A view downriver along the Delaware River shoreline at the Benjamin Franklin Bridge.

The abandoned wooden pilings, piers, and ramps within the river help to diminish the impact on the river shoreline of wave action from passing ships and may help to encourage the formation of tidal mudflats along this portion of the river. Many of the formerly active piers have been neglected for long enough that trees, shrubs, and herbaceous vegetation have colonized them. Between the vacant piers are areas of shallow water and deep mud that in some cases already support tidal mudflat vegetation. These small estuaries help support young fish populations, an essential ecological function of shallow water habitats along the river.

The following is an assessment of the riverfront, its current ecological value, and its restoration potential beginning at the Benjamin Franklin Bridge and continuing upstream to the Bucks County line at Poquessing Creek. The current threats and disturbances along with the conservation recommendation are within each site description.

Note: Information below is truncated to only show the Between Orthodox and Buckius Streets location (i.e. the site).

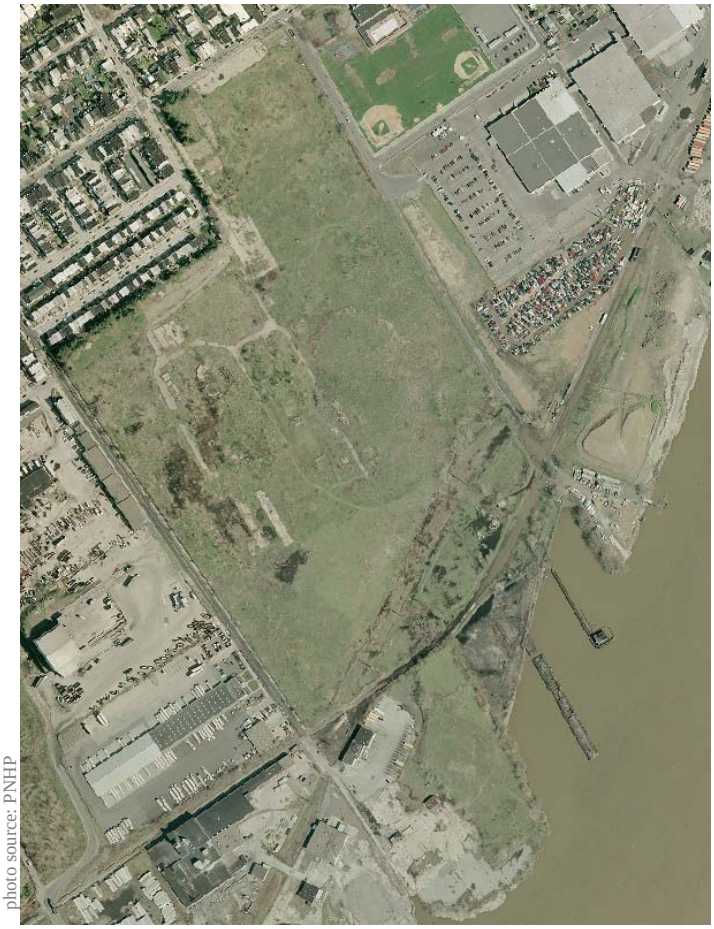

photo source: PNHP

Parcel between Orthodox and Buckius Streets

Between **Orthodox and Buckius Streets** is a 70+ acre privately owned parcel of vacant land that extends from Richmond Street to the riverfront. This area bears a few footprints of previous structures, but for the most part is reverting to herbaceous and woody vegetation and appears from the air to already have begun to resemble a park. The vegetation is likely dominated by weedy introduced plants and early successional native species. A ground survey of this area was not conducted due to inability to obtain the necessary permission. The riverfront at this location contains a mix of rubble-armored seawall, dilapidated piers, and a few more natural looking habitats including a narrow sandy/gravel beach and a small but well-developed tidal marsh. The beach occurs along the river where the shoreline lacks armoring adjacent to two older piers. The tidal marsh occurs between one of the older piers and a small private boat launch. This mudflat habitat appears to contain common emergent aquatic vegetation like yellow pond-lily and pickerel-weed, but may also support less common tidal mudflat vegetation. Biological surveys of this area are recommended to determine its current ecological value and restoration potential. Future development should be excluded from the 100-year floodplain and set back from the river's edge at least 100 meters to provide a corridor of native terrestrial vegetation and public access as a continuation of a Delaware River greenway through the area. In addition, the small tidal marsh could be enhanced by removing obstructions to flooding in this low lying area, increasing the potential for tidal marsh development.

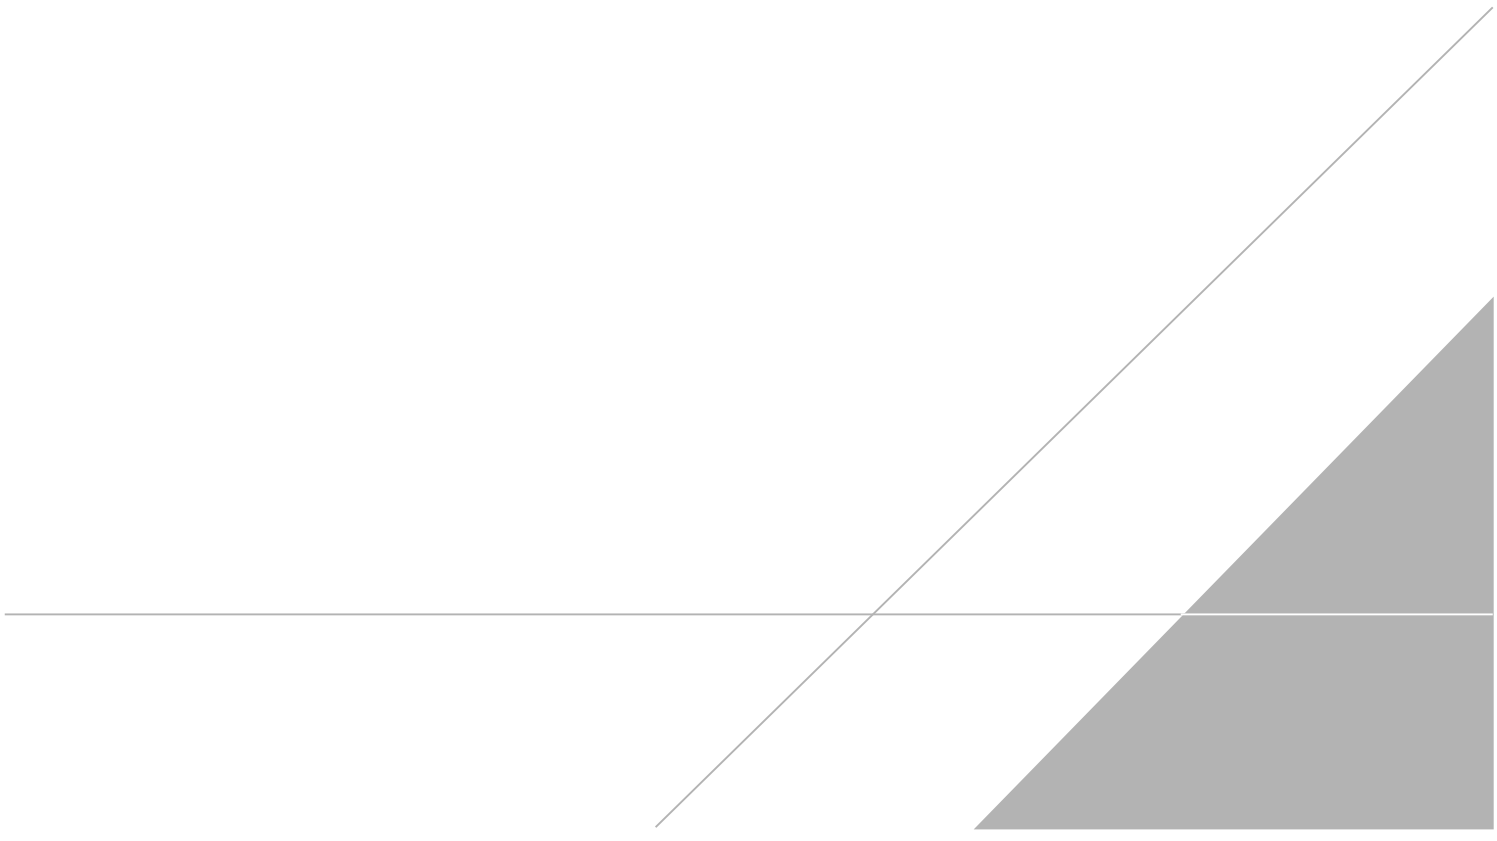
October 2, 2019: Automated Response for Former Philadelphia Coke Plant Site Final Receipt Complete from PDCNR



From: PA Conservation Explorer <RA-NRHeritageexplore@pa.gov>
Sent: Wednesday, October 2, 2019 10:42 AM
To: Buys, Dave
Subject: Former Philadelphia Coke Plant Site Final Receipt Complete

Dear David Buys,

This email is in response to the project you submitted via the PA Conservation Explorer entitled Former Philadelphia Coke Plant Site. A Final receipt has been generated based on the project boundary submitted and can be found at https://conservationexplorer.dcnr.pa.gov/project/former-philadelphia-coke-plant-site-347357. The receipt can be downloaded and/or printed for your files.

NOTE: You must be logged in to your account in order to review the report.

Final Receipt: A Final Receipt is generated under the following circumstances.

- **Finalizing a Project for Environmental Review.** A Final Receipt is created when an applicant finalizes a project in order to initiate the environmental review process. A signed copy of the Final Receipt should be sent to DEP along with any required recommendation or clearance letters from the jurisdictional agencies. See more detailed DEP instructions below.
- **Revising or Updating a Finalized Project.** A new version of the Final Receipt will be generated if an applicant resubmits the project either by editing the project footprint or selecting 'Update Receipt' option. Response letters from the jurisdictional agencies will specify the receipt version; if a new version of the PNDI receipt is generated, a new response letter will be required.

If the project requires consultation with the Department of Conservation and Natural Resources, PA Game Commission and/or PA Fish and Boat Commission, the agencies listed on the receipt have been automatically notified that the project is ready for environmental review. Agencies will not initiate the environmental review until all necessary documents have been uploaded or mailed. Direct correspondence with state agencies is not required to initiate a review, provided the minimum necessary materials are uploaded.

If you have opted to mail in your project documentation, please mail (or email) the documents to the agencies requiring consultation. The agency addresses are listed in Section 6 of the PNDI receipt.

Instructions for projects with potential impacts to the U.S. Fish and Wildlife Service (USFWS): If your project requires consultation with the USFWS, mail your project documents along with a signed copy of the final receipt to the USFWS address listed in Section 6 of the receipt.

DEP instructions for projects with Potential Impacts: The Pa Department of Environmental Protection (DEP) requires that a signed copy of this receipt, along with any required documentation from jurisdictional agencies concerning resolution of potential impacts, be submitted with applications for permits requiring PNDI review. Two review options are available to permit applicants for handling PNDI coordination in conjunction with DEP's permit review process involving either T&E Species or species of special concern. Under sequential review, the permit applicant performs a PNDI screening and completes all coordination with the appropriate jurisdictional agencies prior to submitting the permit application. The applicant will include with its application, both a PNDI receipt and/or a clearance letter

from the jurisdictional agency if the PNDI Receipt shows a Potential Impact to a species or the applicant chooses to obtain letters directly from the jurisdictional agencies. Under concurrent review, DEP, where feasible, will allow technical review of the permit to occur concurrently with the T&E species consultation with the jurisdictional agency. The applicant must still supply a copy of the PNDI Receipt with its permit application. The PNDI Receipt should also be submitted to the appropriate agency according to directions on the PNDI Receipt. The applicant and the jurisdictional agency will work together to resolve the potential impact(s). See the DEP PNDI policy at https://conservationexplorer.dcnr.pa.gov/content/resources.

If you have questions about the contents of the receipt or need further assistance, please visit the contact us page.

Sincerely,

Pennsylvania Department of Conservation and Natural Resources
https://conservationexplorer.dcnr.pa.gov/

Subject: RE: [External] RE: PNDI 628950: Former Philadelphia Coke Plant site
Attachments: 2019.1022-Philly Coke 2018-2019 Sampling Locations.pdf

Hi Kathy,

Arcadis drilled soil borings and excavated test pits at the Philadelphia Coke site this year in March, April, and September as part of a Remedial Investigation. The attached figure shows the location of this year's soil borings (in orange) and test pits (in red). Historical soil boring and test pit locations are shown in black. This year's soil borings were drilled by a small track-mounted Geoprobe, and the test pits were excavated using a rubber-tire backhoe. The soil boring and test pit locations in the eastern portion of the site (east of the utility corridor, closest to the Delaware River) were reached via an existing access road (along which the grass is regularly mowed) and an abandoned railroad right-of-way (which is elevated and regularly mowed). No turtles were observed onsite by our soil sampling team during the work.

We will incorporate feedback from PFBC in the upcoming ecological evaluation and incorporate any ecological-related design aspects in the RI Report and Cleanup Plan to be submitted to PADEP.

Please let me know if you have any other questions.

Thank you. Dave

Thanks. I am thinking of turtle nesting habitat and whether or not a seasonal restriction or fenced work area would be needed without first doing a presence/absence survey.

Hi Kathy.

I will check to see if test pit and boring locations are available. Would a minimum work distance be needed from the river? Any species of concern in particular? Thank you.

Dave

Dave,

I am currently reviewing the above-referenced project for the PA Fish and Boat Commission. Do you have a proposed layout of the test pits and borings available yet? I am wondering in particular about their proximity to the river shoreline habitats. Please let me know; thank you.

Kathy

RE: Species Impact Review (SIR) – Rare, Candidate, Threatened and Endangered Species
PNDI Search No. 628950_1
Former Philadelphia Coke Plant Site
PHILADELPHIA County: Philadelphia City

Dear David Buys:

This responds to your inquiry about a Pennsylvania Natural Diversity Inventory (PNDI) Internet Database search "potential conflict" or a threatened and endangered species impact review. These projects are screened for potential conflicts with rare, candidate, threatened or endangered species under Pennsylvania Fish & Boat Commission jurisdiction (fish, reptiles, amphibians, aquatic invertebrates only) using the Pennsylvania Natural Diversity Inventory (PNDI) database and our own files. These species of special concern are listed under the Endangered Species Act of 1973, the Wild Resource Conservation Act, and the Pennsylvania Fish & Boat Code (Chapter 75), or the Wildlife Code.

Northern Red-bellied Cooter (*Pseudemys rubriventris*, Threatened)
The Northern Red-bellied Cooter is one of Pennsylvania's largest native aquatic turtles. This turtle species is known to inhabit relatively large, deep streams, rivers, ponds, lakes, and marshes with permanent water and ample basking sites. Red-bellied Cooters are restricted to the southcentral and southeastern regions of the Commonwealth. The existence of this turtle species is threatened by habitat destruction, poor water quality and competition with aggressive non-native turtle species that share its range and habitat (e.g. Red-eared Slider).

You supplied descriptions and photographs of the project site. According to the information, potential habitats consistent with those known to support the species of concern may be located on portions of the property. However, current conditions are not having adverse impacts to these habitats or species. Therefore, I conclude that parcel investigated is not resulting in adverse impacts to the species of concern. Future redevelopment of portions of the property may require further investigation to determine how to avoid impacts to these species.

This response represents the most up-to-date summary of the PNDI data and our files and is valid for two (2) years from the date of this letter. An absence of recorded species information does not necessarily imply species absence. Our data files and the PNDI system are continuously being updated with species occurrence information. Should project plans change or additional information on listed or proposed species become available, this determination may be reconsidered, and consultation shall be re-initiated.

If you have any questions regarding this review, please contact Kathy Gipe at 814-359-5186 and refer to the SIR # 51992. Thank you for your cooperation and attention to this important matter of species conservation and habitat protection.

Sincerely,

Christopher A. Urban, Chief
Natural Diversity Section

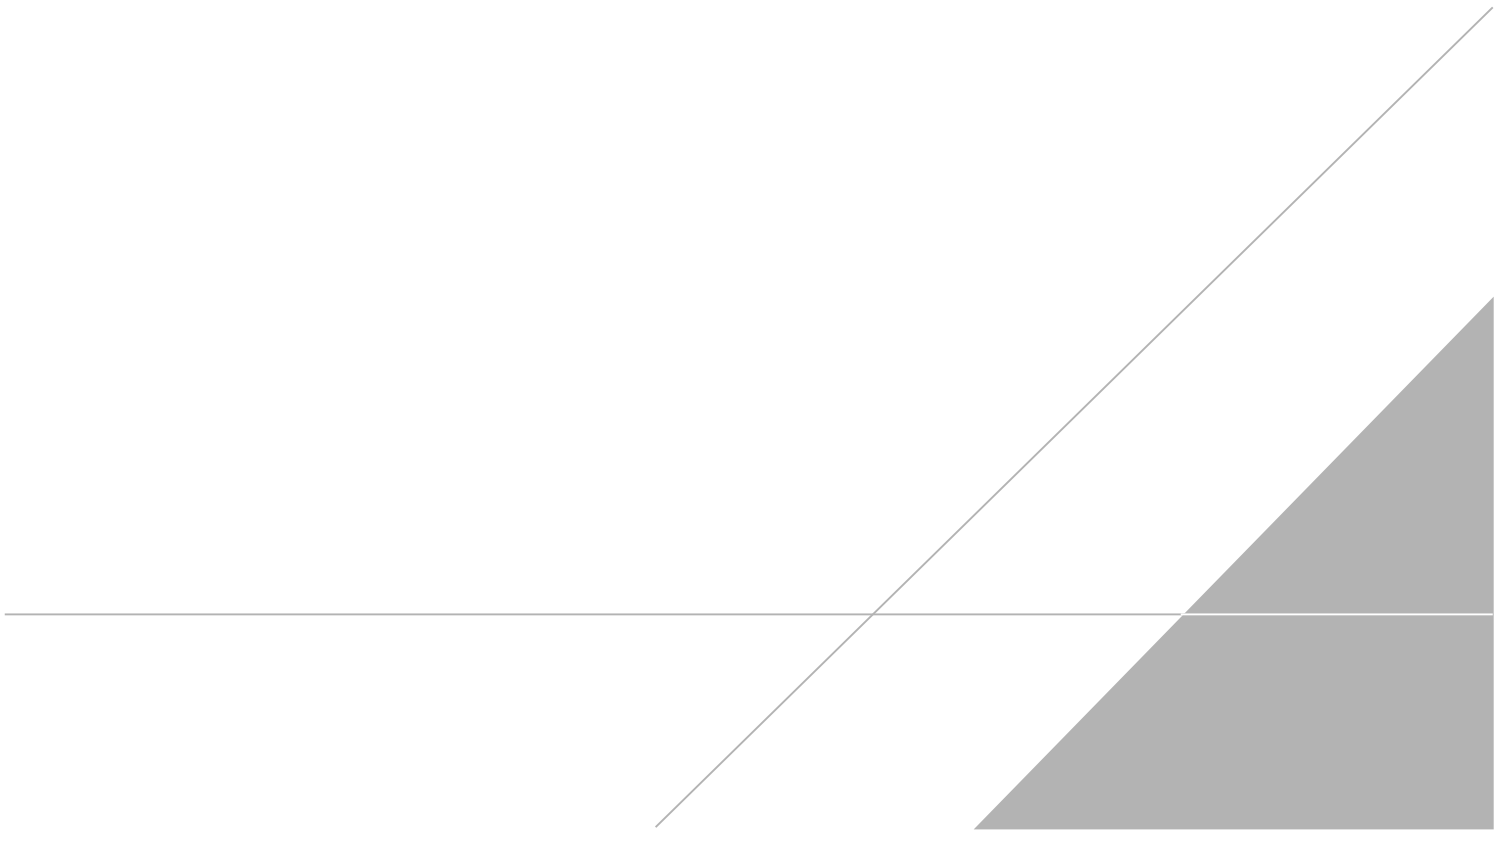
February 2, 2022: Further Consultation with PFBC About the Two Unnamed Endangered Aquatic Species



Brussel, John

From: Vogel, Jason
Sent: Wednesday, February 2, 2022 11:57 AM
To: c-kgipe@pa.gov
Cc: Brussel, John
Subject: PNDI 628950: Former Philadelphia Coke Plant site
Attachments: Arcadis PNDI.pdf; Philadelphia Coke-Herpetological Assoc Rpt-PFBC Response.pdf

Kathy,

Hope this finds you well. Arcadis had interacted with you on follow up to PNDI 628950 in October 2019 regarding the findings of the consultation results noted by PFBC (attached as Arcadis PNDI.pdf). As part of the threatened and endangered species evaluation and consultation for the Former Philadelphia Coke Plant Site, we had used the supporting information to detail and assess the red-bellied cooter use of the site. This information was incorporated into an Act 2 Remedial Investigation Report and Cleanup Plan [RICP] (eFACTS PF No. 831308) prepared for the site and submitted to PADEP.

We received comments from PADEP on the report regarding data gaps in review of potential threatened and endangered species; specifically as: "The report lacked a sufficient ecological evaluation for threatened and endangered species identified in the Pennsylvania Natural Diversity Inventory review. This is a data gap. 25 Pa. Code Sections 250.402(c), 250.404(a)."

In our Act 2 RICP, we evaluated the existing site habitats and potential usage for red-bellied cooter. Additionally, another consulting firm submitted its own PNDI consultation in support of site redevelopment plans (# 720080) and had similar conclusions on the red-bellied cooter. In addition, they provided an additional Phase 1 site-specific survey report on red-bellied cooter. PFBC provided a similar response in its September 23, 2021 letter. From both of these responses, we concluded that site development activities will not threaten the red-bellied cooter. Consultation information for PNDI #720080 and Phase 1 report are attached as Philadelphia Coke-Herpetological Assoc Rpt-PFBC Response.pdf.

In review of PADEP's comment, we are trying to understand if there are additional species of concerns or habitats that require evaluation and description in our RICP to address the data gap.

From the PNDI consultation information for 628950 (attached), besides the red-bellied cooter, the report made note of two endangered species, but these were not identified. **Please identify these two endangered species.**

The consultation materials also referred to the Delaware River Shoreline habitat within the upland and shoreline areas of the site between Orthodox and Buckius Streets. The current site shoreline area consists primarily of fill material, rocks, gravels and sands, with some sparse emergent vegetation (e.g., spatterdock) observed growing in the rock line. The transition area between the shoreline and upland river bank consists of rock, fill material, old bulkhead, and fencing. The vegetation in this transitional area consists primarily of invasive species (e.g., Japanese knotweed, Common reed). The Delaware River Shoreline habitat refers to a listing of threatened and endangered plant and biota species, and intertidal marsh. The current shoreline habitat is not a functioning intertidal marsh. **Does the listing of Delaware River Shoreline habitat within the PNDI require any further site assessment or evaluation to document occurrence at this site?**

If you can provide answers to our question and requested information (bolded) and advise on any other supporting documentation needs typically required for the ecological evaluation, then that would be extremely helpful.

Thank you in advance for your assistance and support on this matter.

Sincerely,

Jason Vogel

RE: Species Impact Review (SIR) – Rare, Candidate, Threatened and Endangered Species
PNDI Search No. 628950_1
Former Philadelphia Coke Plant Site
PHILADELPHIA County: Philadelphia City

Dear Jason Vogel:

This responds to your inquiry about a Pennsylvania Natural Diversity Inventory (PNDI) Internet Database search "potential conflict" or a threatened and endangered species impact review. These projects are screened for potential conflicts with rare, candidate, threatened or endangered species under Pennsylvania Fish & Boat Commission jurisdiction (fish, reptiles, amphibians, aquatic invertebrates only) using the Pennsylvania Natural Diversity Inventory (PNDI) database and our own files. These species of special concern are listed under the Endangered Species Act of 1973, the Wild Resource Conservation Act, and the Pennsylvania Fish & Boat Code (Chapter 75), or the Wildlife Code.

Based on records maintained in the Pennsylvania Natural Diversity Inventory (PNDI) database and our own files, the following rare or protected species are known from the vicinity of the project site:

Common Name (Scientific Name, PA Status)
Atlantic Sturgeon (*Acipenser oxyrinchus*, Endangered)
Shortnose Sturgeon (*Acipenser brevirostrum*, Endangered)
Northern Red-bellied Cooter (*Pseudemys rubriventris*, Threatened)

Rare or protected fish species are known from the vicinity of the project site. Measures to prevent the release of sediment and harmful chemicals into waterways should be implemented. I recommend construction techniques that avoid instream work, sediment release, and changes to water quality and that fuel storage tanks for equipment re-fueling be located at least 100 feet away from waterways. Storm sewers and retention basins should be designed so as to minimize/remove all silt from the water before it is released into the stream. Strict erosion and sedimentation control measures, as well as best management

practices should be employed. According to my review of the project materials presented, there will be no adverse impact to the sturgeon species from the ongoing reclamation of this project site.

Since the data of my last correspondence, Michael Torocco of Herpetological Associates evaluated the habitats on site to determine their potential to support the Northern Red-bellied Cooter (*Pseudemys rubriventris*) (report provided for SIR #53900). According to the report, the site does contain some potential nesting and basking habitat for the species along the Delaware River shoreline. However, current conditions are not having adverse impacts to these habitats or the species. Therefore, I conclude that the parcel investigated is not resulting in adverse impacts to the Northern Red-bellied Cooter.

This response represents the most up-to-date summary of the PNDI data and our files and is valid for two (2) years from the date of this letter. An absence of recorded species information does not necessarily imply species absence. Our data files and the PNDI system are continuously being updated with species occurrence information. Should project plans change or additional information on listed or proposed species become available, this determination may be reconsidered, and consultation shall be re-initiated.

If you have any questions regarding this review, please contact Kathy Gipe at 814-359-5186 and refer to the SIR # 51992. Thank you for your cooperation and attention to this important matter of species conservation and habitat protection.

Sincerely,

Christopher A. Urban, Chief

RE: Species Impact Review (SIR) – Rare, Candidate, Threatened and Endangered Species
PNDI Search No. 720080_1
4501 Richmond Street Philadelphia
PHILADELPHIA County: Philadelphia City

Dear Kevin McCartney:

This responds to your inquiry about a Pennsylvania Natural Diversity Inventory (PNDI) Internet Database search "potential conflict" or a threatened and endangered species impact review. These projects are screened for potential conflicts with rare, candidate, threatened or endangered species under Pennsylvania Fish & Boat Commission jurisdiction (fish, reptiles, amphibians, aquatic invertebrates only) using the Pennsylvania Natural Diversity Inventory (PNDI) database and our own files. These species of special concern are listed under the Endangered Species Act of 1973, the Wild Resource Conservation Act, and the Pennsylvania Fish & Boat Code (Chapter 75), or the Wildlife Code.

You provided the results of a habitat evaluation by a recognized qualified Northern Red-bellied Cooter surveyor, Michael Torocco. Mr. Torocco evaluated the habitats on site to determine their potential to support the species of concern. According to the report, the site within the limit of disturbance does not contain potential habitat for the Northern Red-bellied Cooter. I concur with the results of the evaluation; therefore, I do not foresee the proposed project resulting in adverse impacts to the Northern Red-bellied Cooter.

This response represents the most up-to-date summary of the PNDI data and our files and is valid for two (2) years from the date of this letter. An absence of recorded species information does not necessarily imply species absence. Our data files and the PNDI system are continuously being updated with species occurrence information. Should project plans change or additional information on listed or proposed species become available, this determination may be reconsidered, and consultation shall be re-initiated.

If you have any questions regarding this review, please contact Kathy Gipe at 814-359-5186 and refer to the SIR # 53900. Thank you for your cooperation and attention to this important matter of species conservation and habitat protection.

Sincerely,

Christopher A. Urban, Chief

Notes:

1. The relevant ecological screening benchmarks (ESBs) are selected based on the following hierarchy system:
    1. EcoSSLs
    2. ORNL benchmarks
    3. EPA Region 4
    4. EPA Region 5
    5. ECOTOX
    6. PubChem
2. Letter denotes which ESB was selected for each analyte:
    a. Eco-SSL Avian Soil Screening Benchmark
    b. Eco-SSL Inverts Soil Screening Benchmark
    c. Eco-SSL Mammalian Soil Screening Benchmark
    d. Eco-SSL Plants Soil Screening Benchmark
    e. ORNL Invertebrates Soil Screening Benchmark
    f. ORNL Microbes Soil Screening Benchmark
    g. ORNL Plants Screening Benchmark
    h. EPA R4 Soil Screening Benchmark
    i. EPA R5 ESL Soil Screening Benchmark
    j. PubChem
    k. ECOTOX
3. See reference section below for the ESBs used.
4. CAS = Chemical Abstract Service.
5. COPEC = Consituent of Potential Ecological Concern
6. mg/kg = Milligrams per kilogram
7. NA = Not applicable
8. PAH = Polycyclic Aromatic Hydrocarbon
9. PCB = Polychlorinated biphenyl

EXECUTIVE SUMMARY

This Human Health Risk Assessment (HHRA) was prepared to evaluate potential future exposure of human receptors to constituents of concern (COC) identified in the railroad right-of-way (RR ROW) at the former Philadelphia Coke Plant (the Site). The HHRA was prepared in accordance with the Pennsylvania Department of Environmental Protection (PADEP) Land Recycling and Environmental Remediation Standards Act (Act 2) which is codified in 25 Pennsylvania Code (PA Code) Chapter 250. This HHRA was conducted consistent with the PADEP Land Recycling Program Technical Guidance Manual (PADEP 2021). This focused HHRA is intended to provide supporting information to the Remedial Investigation Report (RIR) and aid in the decision-making process for this portion of the Site.

The Site is located in in the City of Philadelphia and is surrounded by industrial, commercial and mixed residential properties. The Site was used as a manufactured gas plant in the mid-1920s and coking facility from 1929 to 1982. Use of the Site for manufacturing ended in 1989.

Human Health Risk Assessment

The existing ground surface at the RR ROW will not be improved as per an easement that must permit the continuous operation of the Philadelphia Beltway Railroad, although this portion of the railway is currently inactive. Surface soil analytical results from the RR ROW area were compared to the United States Environmental Protection Agency industrial soil Regional Screening Levels (RSLs) for soil. Based on comparison with the Industrial Soil RSLs, COCs identified for the HHRA are benzene, several potentially carcinogenic polycyclic aromatic hydrocarbons, arsenic, chromium, and Aroclor 1260.

The HHRA exposure assessment includes a conceptual site model (CSM) for current and probable future scenarios. The CSM identifies source, release and transport mechanisms, and environmental media that currently show or may show the presence of COCs in the future. Exposure pathways and routes to potentially exposed human populations are identified. The receptor populations with complete or potentially complete pathways to surface soil under current and future anticipated scenarios include outdoor workers and adolescent trespassers. The CSM and exposure evaluation consider the remedial actions described in the Cleanup Plan that will eliminate future exposure pathways

A toxicity assessment was performed following PADEP recommended hierarchy. Cumulative risk and hazards for COC surface soil exposure to future outdoor workers and adolescent trespassers were estimated. All estimated risks and hazards were less than the PADEP target cancer risk of $1x10^{-4}$ and non-cancer hazard of 1. **Current and future anticipated surface soil exposure to receptors of the RR ROW are estimated to be at acceptable levels. The RR ROW does not pose unacceptable risks to human health under current and probable future conditions.**

1 INTRODUCTION

This report summarizes the human health risk assessment (HHRA) for the railroad right-of-way (RR ROW) at the former Philadelphia Coke Plant located in the Bridesburg Borough of Philadelphia, Pennsylvania (the Site). The existing ground surface in the RR ROW will be unimproved per an easement that must permit the continuous operation of the Philadelphia Beltway Railroad, although the use of the rail line is currently inactive. Therefore, potentially complete exposure pathways will remain at the RR ROW, and this document addresses those pathways. The remedy proposed for the overall Site outside of the RR ROW will address potentially complete future exposure pathways by pathway elimination using engineering and institutional controls, as described in the Remedial Investigation Report (RIR) and Cleanup Plan. The HHRA is intended to provide supporting information to the RIR and aid in the decision-making processes used in the Cleanup Plan for the Site. This HHRA was prepared in accordance with the Land Recycling and Environmental Remediation Standards Act (Act 2) guidance (Pennsylvania Department of Environmental Protection [PADEP] 2021) which is codified in 25 Pennsylvania Code (PA Code) Chapter 250.

1.1 Report Organization

The site location, history, description, and characterization are presented in Section 1. The human health risk assessment is provided as Section 2. References are provided in Section 3.

The HHRA is organized to present introductory information in Sections 2 and 2.1. Section 2.2 identifies the constituents of concern (COCs) based on comparison of RR ROW soil data to United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs). Section 2.3 presents an exposure assessment including a conceptual site model (CSM) identifying the current and future potentially exposed populations, exposure pathways, and assumptions (including exposure parameters and exposure point concentrations). Section 2.4 identifies the toxicity values used to evaluate the magnitude or likelihood of adverse health effects. Section 2.5 and Section 2.6 summarize the approach to risk characterization and the results, respectively. Conclusions from the HHRA are presented in Section 2.7.

1.2 Site Location

The Site is located at 4501 Richmond Street between Orthodox Street and Buckius Street as shown on Figure 1. The Site is approximately 63 acres in size and is currently unoccupied. The area in the vicinity of the RR ROW contains commercial and industrial properties consisting of a bus depot, small marina, and car impoundment. To the west is the upland portions of the Site. To the south (along Orthodox Street) and to the north (along Buckius Street) are commercial and industrial properties. To the east is the Delaware River.

The area evaluated in this HHRA is the Philadelphia Beltway RR ROW which is an approximate 1.5-acre narrow strip of land in the eastern portion of the Site, running roughly north-south through the former fuel blending area. The RR ROW is depicted in Figures 1-1 and 1-2.

Figure 1-1: Photograph of the RR ROW (May 2021)

1.3 Site History

The Site was used as a manufactured gas plant in the mid-1920s and coking facility from 1929 to 1982. Use of the Site for manufacturing ended in 1989. Following the 1989 termination of operations, the Site underwent extensive Resource Conservation and Recovery Act (RCRA) closure actions and USEPA issued a Certificate of Completion in 1994. No outstanding closure responsibilities associated with the RCRA Corrective Action remain and the Site has not been occupied since 1991. Based on 1920 Sanborn Fire Insurance Maps, the Philadelphia Beltway RR was installed before the Site was developed for manufacturing operations.

Based on available aerial photographs, the tracks within the RR ROW were in use until at least 1995 and provided rail service to commercial and industrial business north of the Site along the Delaware River. The historical aerial photographs appear to indicate that some of the RR tracks further north were removed between 2010 and 2012, leaving only a spur to access the properties to the properties immediately to the north of the Site.

1.4 Site Description and Characterization

At the RR ROW, the ground surface is primarily comprised of compact ballast and gravel materials with sparse to densely populated vegetation with increasing distance from the center of the tracks. The 2019 wetland delineation activities identified a sparsely vegetated ditch with wetland hydrology and a gravel substrate adjacent to the railroad tracks (RIR, Arcadis 2022). A photograph showing the vegetated railroad ditch is shown as Figure 1-2.

Soil from the RR ROW area was sampled during the two phases of a Site-wide Remedial Investigation (RI; 2003-2006 and 2018-2019). Soil material was collected below RR gravel/ballast, from approximately 0.5 feet below ground surface (bgs) to 2 feet bgs.

The COCs identified in the RR ROW are discussed in Section 2.2.

Figure 1-2: Photograph of Vegetated Railroad Ditch (March 2019)

2 HUMAN HEALTH RISK ASSESSMENT

The potentially complete exposure pathways are outdoor workers, unauthorized trespassers, and utility workers accessing the RR ROW. The Federal Railroad Administration prohibits trespassing on railroad property, anywhere other than a designated pedestrian or roadway crossings. Both authorized worker and unauthorized trespasser receptors may be exposed to surface soils (0-2 feet bgs) in the RR ROW area. It is assumed that utility or construction workers involved in subsurface improvement activities for the RR ROW (e.g., future trenching for installation of electrical service, communications cables, storm water drainage features, etc., if needed) would adhere to safe work practices outlined in the Health and Safety Plan (HASP) prepared for the Site, which is included in the Post-Remediation Care Plan.

2.1 Objectives of Human Health Risk Assessment

The primary objective of this streamlined HHRA is to estimate carcinogenic and non-carcinogenic risks and hazards from exposure to the COCs. To complete this objective, surface soil COCs are identified and evaluated for the potentially complete human health exposure pathways to surface soil in the RR ROW.

2.2 Identification of COCs for Surface Soil

Surface soil samples were collected from 10 locations within the RR ROW area and analyzed for select VOCs, SVOCs, inorganics, pesticides, and polychlorinated biphenyls. Surface soil samples were collected from below RR gravel/ballast to 2 feet bgs (0.5-2 feet bgs).

COCs in surface soils are determined by comparison to the USEPA Regional Screening Levels (RSLs) for Industrial Soil target cancer risk of 1×10^{-6}, and target hazard quotient of 0.1 following PADEP (2021) guidance for the site-specific standard. Constituents are identified as COCs if the maximum detected concentration exceeds the RSL. If an RSL is not available for a constituent, then an available surrogate value is used. If no RSL or surrogate RSL is identified for a detected constituent, but at least one toxicity value is available (see Section 2.4), then that constituent is identified as a COC and carried through the risk assessment. For chromium, only total chromium data was available for the soil data (i.e., no speciation). Therefore, the chromium data was conservatively assumed to be the more toxic hexavalent chromium. The surface soil data for detected constituents compared to the applicable RSLs are presented in Appendix A Table 1 and summarized in Table 1.

The approach to the assessment of lead is different than all other constituents because there currently are no toxicity data for lead that allow a standard quantification of potential risks and hazards associated with lead exposure. The USEPA RSL user guide (2021b) states that soil lead levels less than 400 milligrams per kilogram (mg/kg) are generally safe for residential use and 800 mg/kg for commercial/industrial use. Although two detected lead concentrations; 986 mg/kg from sample PCSB-41R(0.5-2), and 930 mg/kg from sample PCSB-41(0.5) exceed the industrial soil RSL of 800 mg/kg; the average concentration of 317 mg/kg is less than both residential and industrial soil RSLs. Therefore, lead is not identified as a COC for the RR ROW.

The COCs for this HHRA include benzene, benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, carbazole (since no screening level is available), dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene, arsenic, chromium, and Aroclor 1260.

2.3 Exposure Assessment

The exposure assessment discusses potentially complete human exposure pathways under the current and intended future use of the RR ROW. Exposure assessment is the process of measuring or estimating the intensity, frequency, and duration of human exposure to substances present in the environment. A complete exposure pathway is composed of the following four elements (USEPA 1989):

- A source and mechanism of constituent release.
- Retention or transport media.
- A potential contact point with an affected medium.
- An exposure route (i.e., ingestion, dermal contact, inhalation) at the contact point.

Together, these elements are used to evaluate potential exposure to COCs under current and reasonably foreseeable future conditions. If any of the elements are, or will be missing, the exposure pathway is incomplete, and there is no potential for exposure or health risks. This is the premise behind the “pathway elimination” strategy. The exposure assessment is a critical component of the risk assessment process, as it describes the presumed contact between COCs and potential receptors. The following sections present the CSM for the HHRA, detailing potential receptors and exposure pathways, the methods used to calculate the exposure point concentrations (EPCs), and the methods used to estimate intake.

In accordance with the USEPA exposure assessment and risk characterization guidance (USEPA 1992, 1995), doses and risks were calculated for the reasonable maximum exposure (RME) scenario. The RME scenario describes individuals at the upper end of the population distribution (greater than 90th percentile but not above the distribution). In accordance with RAGS (USEPA 1989, 2001), tables were prepared summarizing the values used for the RME daily intake calculations for future-use scenarios and surface soil.

2.3.1 Conceptual Site Model

This section presents the CSM which has been prepared in accordance with the PA Code Title 25, Chapter 250.404 and follows USEPA (1989) guidance. The potential exposure pathways have been identified based on observations from the RI and are described in the following subsections. The identified COCs and assessment of potential exposure pathways to human receptors presented below serve as supporting information within the decision-making process for the evaluation and implementation of remedial alternatives presented in the Cleanup Plan.

The CSM outlines potential source areas, release and transport mechanisms, environmental media that currently show or may show the presence of COCs in the future, possible exposure pathways to potentially exposed human populations, and potential exposure routes. It considers current site conditions and surrounding land use, as well as the most likely future conditions and land use, specific to the RR ROW area (i.e., commercial and/or industrial land use).

Figure 3 contains a graphic illustration of the CSM for the current and future exposure scenarios in the RR ROW. As shown in the figure, the primary exposure source for the human health evaluation of this HHRA is onsite surface soil (defined as 0 to 2 feet bgs). Table 2 includes information on potential pathways and assumptions for future RR ROW receptors.

Current and future exposure routes to groundwater at the Site, including the RR ROW, are incomplete. An Environmental Covenant will prohibit site groundwater use for any purpose. The Environmental Covenant will also restrict site property use to non-residential use and require the HASP to be followed when completing intrusive work within the RR ROW. With groundwater use prohibited by the Environmental Covenant and personal protective equipment required by the HASP for the future utility worker performing intrusive work, there will be no future complete exposure pathway to groundwater at the RR ROW.

2.3.2 Potential Receptors

Potentially exposed receptors were considered under current and probable future use of the RR ROW. This HHRA assumes that future use of the RR ROW will remain the same as current use following site redevelopment. Therefore, within the RR ROW, potential receptor populations include trespassers, outdoor workers, and utility workers. The summary and rationale of current and potential future exposure pathways is included in Table 2.

2.3.2.1 Current Soil Exposure Pathways

Current incomplete and complete exposure pathways via direct contact with soil for incidental ingestion, direct dermal contact, and/or inhalation of windblown particulates (fugitive dusts) or COCs volatilized from soils include:

- Trespassers who may encounter surface soil.
- Outdoor workers (such as lawn maintenance personnel) who may encounter surface soil during non-intrusive maintenance work.
- Utility workers who may be exposed to COCs in surface (and subsurface) soil via incidental ingestion, dermal contact, and the inhalation of VOCs and/or particulates in windblown soil or soil vapor released during intrusive work.

Site-wide conditions such as perimeter chain-link security fencing and groundcover are considered in evaluating exposure pathways. The RR ROW ground surface is mostly compacted ballast and gravel which limit the ability of surface soils to be eroded or mobilized and encountered by human receptors. Additionally, the RR ROW area is enclosed in the site-wide perimeter fencing to deter trespassers. Chain-link access gates are positioned where the RR tracks cross the property boundaries, and FRA regulations prohibit unauthorized individuals from accessing railroad tracks. However, there is still potential for access by the adolescent trespasser. Additionally, a few times a year, outdoor maintenance workers mow herbaceous vegetation and young woody plants to an approximate height of 6 inches or higher. Therefore, current complete exposure pathways exist for the adolescent trespasser and outdoor maintenance worker.

There are no active underground utilities below or near the RR ROW. Therefore, there is not a complete pathway for the utility worker under current conditions.

2.3.2.2 Future Soil Exposure Pathways

Future complete exposure pathways are anticipated via direct contact with soils for incidental ingestion, dermal contact, and/or inhalation of fugitive dusts or COCs volatilized from soils along the RR ROW include:

- Outdoor workers (such as lawn maintenance personnel) who may encounter surface soil during non-intrusive maintenance work.
- Trespassers who may encounter surface soil.
- Utility workers who may be exposed to COCs in surface (and subsurface) soil via incidental ingestion, dermal contact, and the inhalation of VOCs and/or particulates in windblown soil or soil vapor released during intrusive work.

Site-wide, excluding the RR ROW, all potentially complete future exposure pathways will be eliminated as discussed in the Cleanup Plan. Outdoor maintenance workers are expected to access the Site and cross the RR at designated locations on a more frequent basis in the future after most of the Site is redeveloped. Unauthorized RR ROW access and trespassing in the future cannot be ruled out. Therefore, future complete exposure pathways exist for the outdoor maintenance worker and adolescent trespasser.

A former stormwater discharge pipe is underneath and perpendicular to the RR tracks. Although this stormwater pipe is not in use, it may be slip-lined or demolished, removed, and replaced to convey stormwater from the capped and redeveloped Site to the Delaware River. If excavation were required to access and retrofit the stormwater pipe, it would be performed in accordance with the project-specific HASP to eliminate the exposure pathways. The HASP requires utility workers to be: (1) trained as required by occupational safety and health administration (OSHA) Regulation in 29 CFR 1910.120 (HAZWOPER); (2) medically cleared to work at the Site; and (3) medically monitored as per OSHA at 29 CFR 1910.120(f). Any utility workers that may have the potential to contact subsurface soil greater than 2 feet bgs must use personal protective equipment to mitigate soil exposure pathways.

2.3.2.3 Current and Potential Groundwater Exposure Pathways

There is no current groundwater use at the Site. Therefore, the current exposure pathway for groundwater as tap water or industrial water is incomplete. In the future, as part of the redevelopment of the Site, institutional controls will be established that prohibit groundwater use.

There are no groundwater seeps at the RR ROW, so there is no current pathway to groundwater exposure, unless intrusive work is performed below the water table. The depth to groundwater in the vicinity of the RR ROW groundwater ranges from approximately 5 to 9 feet bgs. Only the exposure scenario for the future utility worker is potentially complete. However, as discussed in Subsection 2.3.2.2, future subsurface intrusive activities, if any, will be performed under the HASP. Therefore, no future exposure pathways via direct contact with groundwater for incidental ingestion, dermal contact, and/or inhalation of COCs volatilized from groundwater are evaluated in this HHRA.

2.3.3 Exposure Assumptions

The equations used to evaluate future receptor exposures to surface soil are presented in Table 3 and are used to calculate excess lifetime cancer risk (ELCR) and hazard quotient (HQ) for non-cancer effects. ELCR and HQ are derived based on the most likely exposure routes (ingestion, dermal absorption, and inhalation) and site-specific exposure parameter assumptions. The magnitude of exposure can be estimated by combining EPCs with exposure parameters to calculate a daily dose for each COC. The following sections discuss how EPCs were determined and identify exposure parameters for each receptor identified in Subsection 2.3.2.

2.3.3.1 Exposure Point Concentrations

The EPC is the representative concentration of a constituent in an environmental medium that is potentially contacted by the receptor and is defined by the USEPA as “the arithmetic average of the concentration that is contacted over the exposure period” (USEPA 1989). Either the upper confidence limit (UCL) or the maximum concentration was used to identify the EPCs.

Upper Confidence Limit

The UCL was most frequently used to identify representative concentrations for the COCs. The UCL is a calculated mean that represents with 95% confidence that the true arithmetic mean will be less than the UCL. The high level of confidence (i.e., 95%) is used to compensate for the uncertainty involved in representing site conditions with a finite number of samples. The 95% UCLs were calculated, using the latest ProUCL software available from the USEPA (USEPA 2016). The ProUCL outputs are provided in Appendix B. The 95% UCLs were selected using the output from the ProUCL software unless a greater than 95% UCL was recommended by the software, in which case the 95% UCL using the same method was selected. When ProUCL Version 5.1 (USEPA 2015) recommended two or more 95% UCLs, the relative percent difference (RPD) was used to compare the 95% UCL values: If RPD < 5%, the higher 95% UCL was conservatively selected, but if the RPD ≥ 5%, the estimate that best represented the data set was selected based on the most appropriate 95% UCL method. If the calculated 95% UCL was greater than the maximum detected concentration, the maximum detected concentration was identified as the EPC, which is consistent with USEPA methodology (USEPA 2002a).

Maximum Concentration

If fewer than eight samples and/or less than five detections were available for a constituent in a specific data set, the maximum concentration was identified as the EPC.

The calculated 95% UCLs and selected EPCs are presented in Table 4.

2.3.3.2 Exposure Parameters

The exposure assumptions used in the risk calculations are presented in Table 5 and are summarized by receptor below. In general, default USEPA and/or PADEP exposure parameters were used in the risk assessment (USEPA 2011, 2014, PADEP 2021).

Adult outdoor workers have the potential to be exposed to surface soils through incidental ingestion, dermal contact, or inhalation at the railroad ROW. The body weight for the adult worker is 80 kilograms which is the USEPA default from the Update of Standard Default Exposure Factors (2014). The selected

soil ingestion rate is 50 mg/day, which is the PADEP default non-residential worker ingestion rate (2021). This is appropriate considering that the railroad ROW is small and the worker would be expected to spend at least half of the day in areas other than the railroad ROW. The fraction ingested from the railroad ROW is assumed to be 100 percent. Outdoor workers are assumed to visit the RR ROW once per week at 50 days per year, which is about once per week year-round. The assumed exposed skin surface area (SSA) is 3,527 cm^2, which is the default for adults and includes head, hands, and forearms (USEPA 2014). The adult worker soil-to-skin adherence rate (SAR), 0.12 milligram per square centimeter per day, from USEPA (2014) is used. The exposure time used in inhalation exposure equations is 4 hours per day, or one half of the workday and is based on professional judgment.

Adolescents aged 12 to 21 have the potential to be exposed to surface soils through incidental ingestion, dermal contact, or inhalation at the railroad ROW. The body weight for the adolescent trespasser is 65 pounds, which is the weighted average of the mean recommended values for body weight by age group from the USEPA Exposure Factors Handbook (2011). The selected soil ingestion rate is 50 mg/day, which is the central tendency soil ingestion rate for 6 to <21 years (USEPA 2011); and the fraction ingested from the RR ROW is assumed to be 100 percent. Trespassers are assumed to visit the railroad ROW at a frequency of 50 days per year, which is about once per week year-round. The assumed exposed SAA is 6,032 centimeters squared (cm^2), which is the default for adults and includes head, forearms, hands, and lower legs; this is conservative because the actual SSA for younger adolescents would be less than adults (USEPA 2014). Using this SSA, a trespasser wears shorts and short-sleeved shirts year-round, as they might wear during the warmer months, but certainly not in cooler months. The adult resident 0.07 milligram per square centimeter per day SAR from USEPA (2014) is used. The exposure time selected for inhalation exposure equations is 2 hours per day and is based on professional judgment.

Additional factors are required for the evaluation of the inhalation route. General approaches for the derivation of these factors are included in the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (USEPA 2002). Particulate Emission Factor calculations for wind-blown fugitive dust are included in Table 6. Volatilization factors derived following USEPA 2002, are shown in Table 7.

2.4 Toxicity Assessment

The toxicity assessment describes the relationship between the administered and/or the absorbed dose of a regulated substance and the magnitude or likelihood of adverse health effects (USEPA 1989). For systemic toxicants, or regulated substances that give rise to toxic endpoints other than cancer and gene mutations (called noncarcinogenic effects), the toxicity assessment process determines a threshold value below which adverse noncarcinogenic effects are not expected in the general population, including sensitive subgroups. For regulated substances that are known or suspected to cause cancer, the toxicity assessment defines the relationship between the dose of the regulated substance or agent and the probability of induction of carcinogenic effects.

The toxicity assessment discusses the two general categories of toxic effects (noncarcinogenic and carcinogenic) and constituent-specific toxicity values used to calculate potential risks for these two types of toxic effects. Toxicity values used in the calculations and their sources are presented in Table 8, Table 9, Table 10, and Table 11. Toxicity values for potential noncarcinogenic and carcinogenic effects were

obtained by accessing the toxicity information contained in the current USEPA RSL tables (USEPA 2021b). Toxicity values were obtained following PADEP recommended hierarchy (2021); specifically, toxicity factors were pulled from the USEPA RSL tables and were verified by checking the USEPA Integrated Risk Information System (IRIS; USEPA 2021a) and California Environmental Protection Agency (CalEPA) Toxicity Criteria Database (CalEPA 2021) as well as the sources in the recommended PADEP hierarchy.

2.4.1 Noncarcinogenic Effects

The potential for noncarcinogenic effects is estimated by comparing a calculated exposure dose with a toxicity reference dose. For a given regulated substance, the dose or concentration that elicits no adverse effect when evaluating the most sensitive response in the most sensitive species is referred to as the “no observed adverse effect level.” This level is used to establish noncancer toxicity values, called reference doses (RfDs) for evaluating oral exposures and reference concentrations (RfCs) for evaluating inhalation exposures. The RfD and RfC values represent daily exposure levels that are not expected to cause adverse noncarcinogenic health effects. Table 8 and Table 9 present the available RfDs and RfCs for COCs.

2.4.2 Carcinogenic Effects

Cancer induction in humans and animals by constituents proceeds through a complex series of reactions and processes. Carcinogenic constituents may produce tumors at the point of application or contact, or they may produce tumors in other tissues after they have been distributed throughout the body. Some constituents are associated only with one or two tumor types, while others may cause tumors at many different sites.

In deriving cancer slope factors (CSFs), USEPA generally relies on a conservative approach. This approach involves extrapolating from either the lowest dose or point of departure from laboratory animal data using a mathematical model that plots a line through the zero point, and based on the slope of this dose-response line, assigns a risk level for increasingly smaller doses of a particular compound. While constructing the linear extrapolation from animal or human data, USEPA uses values that are based on a 95% UCL of the dose/response slope. Therefore, any risk estimates derived from the model are based on values higher than those reported in the underlying studies and are not the most likely estimates generated by applying the mathematical model to the actual study data. The UCL for the slope of this line is called the CSF.

CSFs are derived from the conservative assumption that any dose level has a possibility of causing cancer. The cumulative dose, regardless of the particular exposure period, determines the risk. To evaluate inhalation exposures, inhalation unit risks (IURs) that relate cancer potency to a constituent concentration in air are used (USEPA 2009). Table 10 and Table 11 present the CSF and IUR for each constituent considered to be a carcinogen. Relative potency factors (RPFs) have been applied to the available toxicity values for benzo(a)pyrene and for other carcinogenic PAHs (cPAHs) in IRIS and subsequently presented in Table 10 and Table 11.

USEPA has evaluated cancer risks from early-life exposure as compared to those from exposures occurring later in life. Some constituents cause cancer by a mutagenic mode of action (MOA) and for

those constituents, lifestage differences in both exposure and dose-response are considered (USEPA 2005). In supplemental guidance (USEPA 2005), USEPA recommends that when carcinogens, such as cPAHs, have a mutagenic MOA and appropriate chemical-specific data are not available on susceptibility from early life exposures, then it is appropriate to apply a default safety factor called an age-dependent adjustment factor (ADAF) to risk calculations when evaluating cancer risk associated with exposure for children 0 to 16 years old. For ages 2 to 16 years, the ADAF is 3. For this risk assessment, the COCs benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and chromium (assumed to be hexavalent chromium) are classified by USEPA as mutagenic. An ADAF of 3 was applied to the ELCR calculations for cPAHs in the trespasser scenario for ages 12 to 16. The ADAF used is the average for the adolescent age range, where an ADAF of 3 is used for each year from age 12 to 16, and an ADAF of 1 is used for each year from age 16 to 21. The approximate average ADAF of 1.9 (for the adolescent age range) is used as presented in Table 5.

2.4.3 Dermal Toxicity Values

The USEPA has not yet developed toxicity values specific to dermal exposure. For this reason, the oral toxicity values (RfDo and CSFo) and the fraction absorbed dermally from soil, also known as the dermal absorption efficiency (ABS_d) were used to derive adjusted toxicity values (RfDa and CSFa) (adjusted to dermal dose) for use in assessing dermal exposure (USEPA 1989, 2004):

Table 12 and Table 13 both includes the dermal calculations which incorporate the ABS_d into the calculations, the dermal route equations are also presented in Table 3.

2.5 Risk Characterization Approach

Risk characterization involves estimating the magnitude of the potential adverse health effects of the hazardous constituents under study and making summary judgments about the nature of any identified health threat to the defined receptor populations. It combines the results of the dose-response (toxicity) and exposure assessments.

A distinction is made between non-carcinogenic and carcinogenic endpoints, and two general criteria are used to describe risk: the HQ for non-carcinogenic effects and the ELCR for constituents evaluated as human carcinogens. Cancer risks and non-cancer hazards were calculated for each receptor for each potentially complete exposure pathway. Calculations were based on a combination of site-specific assumptions and default exposure parameters to the extent applicable.

2.5.1 Non-Cancer Hazard Quotient

Estimated doses were averaged over the expected exposure period to evaluate non-carcinogenic effects. The HQ is the ratio of the estimated dose and the RfD. An HQ greater than 1 indicates that the estimated dose for that constituent exceeds the RfD. This ratio does not provide the probability of an adverse effect. Although an HQ less than 1 indicates that health effects are not likely to occur, an HQ that exceeds 1 does not imply that health effects will occur, but that health effects are possible.

The sum of the HQs is the hazard index (HI). A limitation with the HI approach is the assumption of dose additivity. It does not account for effects on different target organs or different mechanisms of actions. Consequently, the summing of HIs for several constituents that are not expected to induce the same type

of effects or that do not act by the same mechanism may overestimate the potential for toxic effects (USEPA 1989). Consistent with USEPA risk assessment guidelines for chemical mixtures, if the total HI for an exposure scenario exceeds 1, it is incumbent on a risk assessor to segregate HQs by target organ/critical effect (USEPA 1989). Therefore, if the calculated HI exceeds 1 as a consequence of summing several HQs for constituents not expected to induce the same type of effects or that do not act by the same mechanism, the HIs were segregated by effect and mechanism of action to derive separate HIs for each target-organ/critical-effect group (USEPA 1989).

2.5.2 Excess Lifetime Cancer Risk

The ELCR is an estimate of the potential increased risk of cancer that results from lifetime exposure, at specified average daily dosages, to constituents detected in media at a site. Estimated doses or intakes for each constituent were averaged over the hypothesized lifetime of 70 years. It is assumed that a large dose received over a short period is equivalent to a smaller dose received over a longer period, as long as the total doses are equal. The ELCR is calculated as the product of the daily dose and the CSF. The risk estimate is considered to be an upper-bound estimate; therefore, it is likely that the true risk is far less than that predicted by the model.

2.6 Risk Characterization Results

The following sections discuss the risk characterization results for the outdoor worker and adolescent trespasser. For non-cancer effects, COCs were identified as constituents contributing to a target organ-specific HI greater than 1. In the context of the site-specific standard, PADEP states potential excess upper-bound lifetime risk from known or suspected carcinogens is acceptable if it falls within the target risk range of 1×10^{-4} to 1×10^{-6}, the cumulative excess risk may not be greater than as set forth in 25 Pa. Code § 250.402(b)(1) (2021). COCs were identified as constituents with an ELCR greater than 1×10^{-4}.

2.6.1 Site Outdoor Worker

Future site outdoor workers may be exposed to COCs in surface soil in the RR ROW. The HI associated with hypothetical future site outdoor worker exposure to RR ROW surface soil equals 0.09 and is less than the target HI of 1. The ELCR associated with hypothetical future site worker exposure to RR ROW surface soil equals 1×10^{-5}, which is within PADEP's cumulative ELCR range of 1×10^{-4} to 1×10^{-6}.

2.6.2 Adolescent Trespasser

Future adolescent trespassers may be exposed to COCs in surface soil in the RR ROW. The HI associated with hypothetical future adolescent trespasser exposure to RR ROW surface soil equals 0.08 and is less than the target HI of 1. The ELCR associated with hypothetical future adolescent trespasser exposure to RR ROW surface soil equals 7×10^{-6}, which is within PADEP's cumulative ELCR range of 1×10^{-4} to 1×10^{-6}.

2.6.3 Discussion of Uncertainties

Risk assessment inherently involves the use of assumptions, judgments, and incomplete data to varying degrees that may contribute to decision uncertainty in either direction. Considering the uncertainties

associated with components of the risk assessment process provides a meaningful interpretation and thorough understanding of the potential for human health risk.

A basic assumption underlying this risk assessment is that the surface soil data adequately characterize environmental conditions to which potential receptors are exposed. Sources of uncertainty associated with environmental sampling can be reduced through a well-designed sampling plan, use of appropriate data collection techniques, and implementation of quality assurance and quality control measures. As discussed in Section 3.1.7 of the RIR, the data used in the RIR meet quality assurance and quality control requirements for collection and analysis. In addition, the Supplemental RI data underwent Tier 2 validation for each sample delivery group. The RR ROW dataset is small (only 10 samples for the area) but sample locations were biased toward more impacted areas. Additionally, the RR ROW dataset consists of data for soil collected below cover material consisting of approximately 6-inches of compact gravel and ballast (i.e., coarse material lacking in fines in which COCs could be absorbed). The existing vegetation and compact gravel and ballast reduce the potential for human exposure to the impacted soil underneath. Therefore, the potential for risks related to the RR ROW may be overestimated.

Uncertainty is inherent in the selection of COCs for the risk assessment. Eliminating regulated substances in the COC screening process can lead to lower estimates of potential health effects than inclusion of all analytes. However, the RSLs used to identify COCs are derived using conservative exposure assumptions and peer-reviewed toxicity values. Due to the conservative nature of risk-based screening levels, the possibility of overlooking a regulated substance that significantly contributes to an individual's total risk is considered very minimal.

For this HHRA conservative assumptions were made to assign surrogates for constituents with no available RSLs and/or toxicity values. Hexavalent chromium RSLs and toxicity values were used for the data assessment of total chromium since speciated chromium data were not available. There is no history of hexavalent chromium use or evidence of presence at the Site, therefore, the risk from exposure to chromium is likely overestimated.

The selection of exposure point concentrations of 95% UCL or maximum detected concentration for COCs (and average mean detected concentration for lead) is meant to be a conservative estimate on the mean concentration within the exposure area.

There is uncertainty associated with the exposure assessment, particularly in the assumptions and exposure factors used to characterize hypothetical future exposure. Exposure frequency, exposure time and skin surface area exposed for dermal contact are all parameters that are based on professional judgement. Chemical specific values such as volatilization factors and dermal absorption fractions are based on laboratory studies and chemical constants. Given that these exposure frequencies constituent-specific values are conservative and may overestimate actual exposures, associated risks and hazards for these receptor groups may also be overestimated.

There are uncertainties in the toxicity values used to estimate ELCR and HQs. In most cases, toxicity values are derived by extrapolating from laboratory animal data to humans. Laboratory animals may be exposed to massively high doses of particular regulated substances over an entire lifetime. As such, these studies do not represent realistic environmental exposures. In addition, humans are different than laboratory animals. Many, if not most, animals used for laboratory studies are genetically designed to be more sensitive than humans to specific compounds. In addition, the effects shown by animals in the high-

dose studies are often very different than effects reported by humans in parallel epidemiological studies. This is because a specific regulated substance may have a different mechanism of action in laboratory animals than it does in humans. Uncertainty factors are applied in the toxicity value calculation to avoid underestimating the potential for adverse human health effects. The combined effect is that the potential for adverse health effects in humans is likely to be over-estimated.

2.7 Conclusions

As discussed in detail in the RIR and Cleanup Plan for the Site, exposure to surface soil at the RR ROW will be the only potentially complete future exposure pathway remaining after implementation of the Cleanup Plan and site redevelopment. There is no identified unacceptable risk associated with current and probable future adolescent trespasser or adult outdoor worker receptors exposed to surface soil at the railroad ROW**. Based on the HHRA findings the RR ROW does not pose unacceptable risks to human health under current and probable future conditions and further assessment of surface soil is not warranted.**

Notes:
[a] Only detected constituents are presented.
[b] Depth interval is presented in feet below ground surface.
[c] Screening levels are the United States Environmental Protection Agency (USEPA) Industrial Soil Regional Screening Levels (RSL) ("&RSL&"), and are based on a target cancer risk of 1×10^{-6} and a target non-cancer hazard of 0.1 (to account for additive effects).
[d] A constituent with a maximum detected concentration above the screening level (ASL) was identified as a COC. A constituent with a maximum detected concentration below the screening level (BSL) was not identified as a COC.
[e] For chromium, the hexavalent chromium RSL is used as a surrogate for total chromium for COC selection.
[f] For lead, the arithmetic average of detected concentrations (317 mg/kg) is compared to the RSL for COC selection.

Abbreviations:

–	Not applicable.	COC	Constituent of concern.
%	Percent.	FOD	Frequency of detection.
ave	average	mg/kg	Milligram per kilogram.

Table 2
Potential Exposure Pathways
Railroad Right of Way
National Grid Former Philadelphia Coke Plant
Philadelphia, Pennsylvania

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Pathway Eliminated?	Potential Exposure Pathway and Assumptions
Current and Future	Soil	Surface Soil	Railroad Right-of-Way	Trespasser	Adolescent	Ingestion	No	Exposed surface soil may be contacted in the event that an unauthorized person accesses the area; there are no future plans for the installation of perimeter fencing.
						Dermal Contact	No	
						Inhalation	No	
		Surface Soil	Railroad Right-of-Way	Outdoor Worker	Adult	Ingestion	No	Under the redevelopment scenario, future site workers performing outdoor maintenance work may be exposed to surface soil in the railroad right-of-way, even if only passing through to access other site areas.
						Dermal Contact	No	
						Inhalation	No	
		Surface Soil	Railroad Right-of-Way	Recreational User	NA	Ingestion	-	The railroad right-of-way is not planned for recreational use. Under the current/future scenario any recreational users engaging in passive recreation would be trespassing and evaluated under the trespasser scenario.
						Dermal Contact	-	
						Inhalation	-	
		Surface Soil	Hypothetical Workplace	Indoor Worker	Adult	Ingestion	Yes	There are no occupied or unoccupied buildings, or redevelopment plans to construct buildings in the railroad right-of-way in the future.
						Dermal Contact	Yes	
						Inhalation	Yes	
		Surface Soil	Hypothetical Residence	Resident	Adult/Child	Ingestion	Yes	The railroad right-of-way is currently zone as commercial/industrial use, the probably future usage is consistent with current. Any off-site resident access of the railroad right-of-way would be evaluated under the trespasser scenario.
						Dermal Contact	Yes	
						Inhalation	Yes	
		Surface & Subsurface Soil	Hypothetical Excavation/Trench	Utility Worker	Adult	Ingestion	Yes	Exposure route is complete for utility workers installing subsurface utilities (e.g., stormwater piping, electrical, communication). However, there are no active utilities in the RR ROW, and any work that has the potential to disturb subsurface soil and groundwater will be performed in accordance with the project-specific HASP, as outlined in HHRA Subsection 2.3.2.2.
						Dermal Contact	Yes	
						Inhalation	Yes	
	Groundwater	Shallow Groundwater	Hypothetical Excavation/Trench	Utility Worker	Adult	Ingestion	Yes	Exposure route is complete for utility workers installing subsurface utilities (e.g., stormwater piping, electrical, communication). However, there are no active utilities in the RR ROW, and any work that has the potential to disturb subsurface soil and groundwater will be performed in accordance with the project-specific HASP, as outlined in HHRA Subsection 2.3.2.2.
						Dermal Contact	Yes	
						Inhalation	Yes	
		Tapwater	Hypothetical Workplace	Indoor Worker	Adult/Child	Ingestion	Yes	In the future, an environmental covenant will prohibit groundwater use; therefore, no potable water wells may be installed at the Site once the covenant is in-place.
						Dermal Contact	Yes	
						Inhalation	Yes	
			Hypothetical Residence	Resident	Adult	Ingestion	Yes	
						Dermal Contact	Yes	
						Inhalation	Yes	
		Indoor Air	Workplace	Indoor Worker	Adult	Inhalation	Yes	An existing easement agreement dictates that continuous operation of the railroad must be permitted, therefore it is unlikely that buildings could be constructed at the railroad right-of-way.
			Hypothetical Residence	Resident	Adult/Child	Inhalation	Yes	

Notes:
1. Site-wide potentially complete pathways from the conceptual site model are included in this table. Only the Railroad Right-of-Way receptors apply to this human health risk assessment.

Table 3
Risk and Hazard Equations for Site Worker and Trespasser Exposure to Soil
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Route-Specific Risk/Hazard Equations:

Oral: $ELCR_o$ *or* $HQ_o = \frac{EPCs \times RBF \times ADAF \times FI \times IRs \times EF \times ED}{(10^6\ mg/kg) \times BW \times (AT_C\ or\ AT_{NC}) \times ([1/CSF_o]\ or\ RfD_o)}$

Dermal: $ELCR_d$ *or* $HQ_d = \frac{EPCs \times ADAF \times SSAs \times SAR \times ABSd \times EF \times ED}{(10^6\ mg/kg) \times BW \times (AT_C\ or\ AT_{NC}) \times ([1/CSF_d]\ or\ RfD_d)}$

Inhalation: $ELCR_i$ *or* $HQ_i = \frac{EPCs \times ADAF \times ET \times CF1 \times EF \times ED}{(VF\text{-}sl) \times (AT_C\ or\ AT_{NC}) \times ([1/IUR \times 10^{-3}\ mg/\mu g]\ or\ RfC)}$

$VF\text{-}sl = \frac{Q/C_{vol} \times [3.14 \times D_A \times T]^{1/2}}{2 \times \rho_b \times D_A \times (10{,}000\ cm^2/m^2)}$ — used for volatiles

$PEF_{wind} = \frac{Q/C_{wind} \times (3{,}600\ sec/hr)}{RPF \times (1\text{-}V) \times (U_m/U_t)^3 \times F(x)}$ — used for non-volatiles

$D_A = \frac{[(\theta_{as}^{10/3} \times D_{air} \times Ho) + (\theta_{ws}^{10/3} \times D_{wat})] / \theta_T^2}{(\rho_b \times Koc \times Foc) + \theta_{ws} + (\theta_{as} \times Ho)}$

TOTAL CANCER RISK: $ELCR = ELCR_o + ELCR_d + ELCR_i$

TOTAL NON-CANCER HAZARD: $HI = HQ_o + HQ_d + HQ_i$

Variable Definitions:

θ_{as}	Air-filled porosity of the soil (unitless) (Table 7).
θ_T	Total soil porosity (unitless) (Table 7).
θ_{ws}	Water-filled porosity of the soil (unitless) (Table 7).
ρ_b	Dry soil bulk density (g/cm³) (Table 7).
ABSd	Dermal absorption efficiency (unitless).
ADAF	Age-Dependent Adjustment Factor for evaluation of risk from constituents with a mutagenicity mode of action (Table 5).
AT_C	Averaging time for cancer effects (days) (Table 5).
AT_{NC}	Averaging time for non-cancer effects (days) (Table 5).
BW	Body weight (kg) (Table 5).
CF	Conversion factor 0.042 day/hour.
C_{sat}	Constituent saturation limit in soil (mg/kg) (Table 7).
CSF	Cancer slope factor for oral (CSFo) or dermal (adjusted to an absorbed dose, CSFa) exposure (kg-day/mg [inverse mg/kg/day]) (Table 10).
D_A	Apparent diffusivity in soil (cm²/sec) (Table 7).
D_{air}	Constituent diffusivity in air (cm²/sec) (Table 7).
D_{wat}	Constituent diffusivity in water (cm²/sec) (Table 7).
ED	Exposure duration (years) (Table 5).
EF	Exposure frequency (days/year) (Table 5).
ELCR	Excess lifetime cancer risk (unitless) from the following pathways: oral ($_o$), dermal ($_d$), and inhalation ($_i$).
EPCs	Exposure point concentration in soil (mg/kg) (Table 4)
ET	Exposure time (hrs/day) (Table 5).
FI	Fraction ingested from area of concern (unitless) (Table 5).
Foc	Fraction organic carbon in the soil (unitless) (Table 7).
HI	Hazard index for non-cancer effects (unitless); sum of the HQs.
Ho	Dimensionless Henry's law constant (unitless); calculated as Ho = H / RT (Table 7).
HQ	Hazard quotient for non-cancer effects (unitless) from the following pathways: oral ($_o$), dermal ($_d$), and inhalation ($_i$).
IRs	Ingestion rate of soil (mg/day) (Table 5).
IUR	Inhalation unit risk (m³/mg) (Table 11).
Koc	Organic carbon partition coefficient (cm³/g = mL/g = L/kg) (Table 7).
PEF_{wind}	Particulate emission factor due to wind (m³/kg) (Table 6).
Q/C_{vol}	Volatile emission flux per unit concentration [(g/m²/sec)/(kg/m³)] (Table 7).
Q/C_{wind}	Particulate emission flux per unit concentration [(g/m²/sec)/(kg/m³)] (Table 6).
RBF	Relative bioavailability factor; constituent specific; default of 100% (i.e., 1) unless otherwise indicated (unitless). RBF for arsenic in soil was set at 60% (i.e., 0.6) consistent with USEPA recommendations (USEPA 2021b).
RfC	Reference concentration (mg/m³) (Table 9).
RfD	Reference dose for oral (RfDo) and dermal (adjusted to an absorbed dose, RfDa), exposure (mg/kg/day) (Table 8).
RPF	Respirable particle fraction (0.036 g/m²/hr) (Table 6).
SAR	Soil-to-skin adherence rate (mg/cm²/day) (Table 5).
SSAs	Exposed skin surface area for soil contact (cm²) (Table 5).
T	Exposure interval (sec) (Table 7).
VF-sl	Soil volatilization factor (m³/kg) (Table 7).
x	Intermediate value in the calculation of PEF; x = 0.886 × (Ut/Um) (Table 6).

Abbreviations:

cm²	Square centimeter.	m²	Square meter.
g	Gram.	m³	Cubic meter.
hr	Hour.	mg	Milligram.
kg	Kilogram.	µg	Microgram.
m	Meter.	sec	Second.

Table 4
Exposure Point Concentrations - Surface Soil
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Constituent of Concern	Detected Concentrations		Exposure Point Concentration [a]			
	Arithmetic Mean (mg/kg)	Maximum (mg/kg)	Selected Value (mg/kg)	Statistic		Rationale
Volatile Organic Compounds						
Benzene	6.32E+00	6.32E+00	6.32E+00	max		UCL cannot be calculated
Semi-Volatile Organic Compounds						
Benz(a)anthracene	1.25E+01	6.15E+01	6.15E+01	UCL	95% Adjusted Gamma UCL	UCL < max
Benzo(a)pyrene	1.13E+01	5.48E+01	5.48E+01	UCL	95% Adjusted Gamma UCL	UCL < max
Benzo(b)fluoranthene	1.36E+01	6.26E+01	6.26E+01	UCL	95% Adjusted Gamma UCL	UCL < max
Carbazole	6.60E+00	2.94E+01	2.94E+01	max		UCL > max
Dibenz(a,h)anthracene	2.88E+00	1.48E+01	1.48E+01	UCL	Gamma Adjusted KM-UCL	UCL < max
Indeno(1,2,3-cd)pyrene	7.63E+00	3.56E+01	3.56E+01	UCL	95% Adjusted Gamma UCL	UCL < max
Naphthalene	1.69E+01	1.00E+02	1.00E+02	max		UCL > max
Metals						
Arsenic	1.99E+01	4.27E+01	4.27E+01	UCL	95% H-UCL	UCL < max
Chromium	3.76E+01	6.94E+01	6.94E+01	UCL	95% KM Adjusted Gamma UCL	UCL < max
Polychlorinated Biphenyls						
Aroclor 1260	2.69E-01	3.93E-01	3.93E-01	UCL	95% KM (t) UCL	UCL < max

Notes:

max Maximum.
mg/kg Milligram per kilogram.
UCL Upper confidence limit.

[a] The exposure point concentration (EPC) was the lower value of either the 95 percent (%) UCL or the maximum concentration, where the UCL was incalculable.

The UCLs were calculated using ProUCL version 5.1.00 (USEPA 2016b). The UCL used is the one recommended by ProUCL, unless a greater than 95% UCL was recommended, in which case the 95% UCL was selected.

Soil - Inhalation						
Exposure Time	ET	hour/day	4	PJ [c]	2	PJ

Table 5
Receptor Exposure Parameters
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Notes:

[a] The averaging time for cancer risk is the expected lifespan of 70 years, expressed in days. The averaging time for non-cancer hazard is the total exposure duration (ED), expressed in days.

[b] The body weight for an adolescent trespasser is the weighted average of 65 lbs for ages 11 to <16 years and 71.6 lbs for ages 16 to <21 years (Table 8-1).

[c] The exposure frequency for an onsite worker was set at 50 days per year, assuming site visits one day per week regardless of weather, for approximately 4 hours a day, or one half of a workday.

[d] The exposure frequency for an adolescent trespasser was set at 50 days per year, assuming one day per week regardless of weather.

[e] The age-dependent adjustment factor is the average for the adolescent age range (years 12-16 = 3, years 16-21 = 1)

[f] The incidental soil ingestion rate for the on-site worker was set at 50 mg/day, the PADEP non-residential worker default.

[g] The incidental soil ingestion rate for the trespasser was set at the central tendency soil ingestion rate for 6 to <21 years.

[h] The skin surface area (SSA) for the site worker is set at the default for adult worker exposure and includes head, hands, and forearms.

[i] The skin surface area (SSA) for the adolescent trespasser is set at the default for adult resident exposure and includes head, forearms, hands, and lower legs.

Abbreviations:

cm^2 Square centimeters.
kg Kilogram.
mg Milligram.
µg Microgram.

PJ Professional judgment.

Table 6
Soil Particulate Emission Factors
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Particulate Emission Factor:				
PEF_{wind}	=	9.96E+09	m^3/kg	Particulate emission factor (m^3/kg) due to wind under passive conditions; site-specific using USEPA (2002) equation.

Particulate Emission Factor for Wind-Blown Fugitive Dust for Commercial/Industrial and Residential Scenarios

$$PEF_{wind} = Q/C_{wind} \times \left[\frac{3600}{0.036 \times (1-V) \times \left(\frac{U_m}{U_t} \right)^3 \times F(x)} \right]$$

Input Parameters:				
F(x)	=	0.0759	unitless	Function of x; $F(x) = 0.18 \times (8x^3 + 12x) \times \exp(-x^2)$ (USEPA 2002 default).
Q/Cwind	=	93.77	$(g/m^2/sec)/(kg/m^3)$	Wind-related particulate emission flux per unit concentration (USEPA 2002 default).
RPF	=	0.036	$g/m^2/hour$	Respirable particle fraction (USEPA 2002 default).
U_m	=	4.16	m/sec	Mean annual wind speed for Philadelphia, PA (NOAA 2018).
U_t	=	11.32	m/sec	Equivalent threshold value of windspeed at 7 meters (USEPA 2002 default).
V	=	0.75	unitless	Fraction vegetative cover (USEPA 2002 default).
x	=	2.411	unitless	Function of U_t/U_m; $x = 0.886 \times (U_t/U_m)$ (USEPA 2002 default).

Abbreviations:

g	Gram.	m^3	Cubic meter.
kg	Kilogram.	PEF_{wind}	Particulate emission factor due to wind (m^3/kg).
km	Kilometer.	sec	Second.
NOAA	National Oceanic and Atmospheric Administration.	USEPA	United States Environmental Protection Agency.
m^2	Square meter.		

Table 7
Soil Volatilization Factors
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Constituent	Constituent Specific Physical Parameters [a]									
	Molecular Weight (MW) (g/mol)	Melting Point (Tm) (°C)	Henry's Law Constant at 25°C (H) (atm-m³/mol)	Diffusivity in Air (D_{air}) (cm²/sec)	Diffusivity in Water (D_{wat}) (cm²/sec)	Partition Coefficient (Koc) (mL/g)	Solubility in Water (S) (mg/L)	Enthalpy of vaporization at boiling point, (ΔH_v) (cal/mol)	Normal Boiling Point (Tb) (K)	Critical Temperature (Tc) (K)

Input Parameters:

Soil =	SL	sandy loam	Soil type (site-specific).
Ts =	15.6	°C	Average soil temperature (PADEP 2021a) (site-specific).
Ts =	289	K	Temperature in Kelvin.
Foc =	0.002	unitless	Fraction organic carbon (USEPA 2002 default).
ρ_b =	1.62	g/cm³	Soil dry bulk density for sandy clay (USEPA 2017).
θ_T =	0.387	unitless	Total soil porosity for sandy clay (USEPA 2017).
θ_{as} =	0.284	unitless	Air-filled soil porosity [= θ_T - θ_{ws}].
θ_{ws} =	0.103	unitless	Water-filled soil porosity for sandy clay (USEPA 2017).
Q/C_{vol} =	68.18	(g/m²/sec)/(kg/m³)	Volatilization flux per unit concentration under passive conditions (USEPA 2002 default).
Q/C_{sa} =	14.31	(g/m²/sec)/(kg/m³)	Volatilization flux per unit concentration under soil invasive conditions (USEPA 2002 default).
Ttres =	2.8E+08	second	Exposure interval for a trespasser scenario (based on 9 years).
Twrkr =	7.9E+08	second	Exposure interval for a commercial and industrial scenario (based on 25 years).
F_D=	0.187	unitless	Dispersion Correction Factor (site-specific).

Notes:

[a] Constituent-specific parameters were obtained from the Chemical Specific Parameters Table from the Regional Screening Level Table (USEPA 2021b).
[b] Enthalpy of vaporization and Henry's Law Constant were adjusted for soil temperature based on USEPA recommended methods (USEPA 2001).
[c] Csat and VF calculated using equations from USEPA 2002. See Table 3 and Table .

Abbreviations:

°C	Degress Celsius.	g/mol	Gram per mole.	mg/kg	Milligram per kilogram.
atm-m³/mol	Atmosphere per cubic meter per mole.	g/m²/sec	Gram per meter squared per second.	mg/L	Milligram per liter.
cal/mol	Calorie per mol.	K	Kelvin.	mL/g	Milliliter per gram.
cm²/sec	Centimer squared per second.	kg/m³	Kilogram per cubic meter.	NV	No Value
g/cm²	Gram per cubic centimeter.	m³/kg	Cubic meter per kilogram.

Notes:
[a] Only detected constituents of concern are presented.
[b] The UCLs were calculated using United States Environmental Protection Agency (USEPA) ProUCL version 5.1.00 ("&ProUCL&"). See Table 3.
EPCs marked with "max" are based on the maximum detected concentration.
[c] Dermal absorption efficiency (ABSd) for uptake of constituents from a soil matrix (unitless) (USEPA 2021b).
[d] Relative bioavailability factor is constituent-specific; default of 100% (i.e., 1) unless otherwise indicated (unitless).
RBF for arsenic in soil was set at 60% (i.e., 0.6) consistent with USEPA recommendations (USEPA 2021b).
[e] The volatilization factor for soil ([VF] identified with [V]), is derived in Table 7, while the particulate emission factor ([PEF] identified with [P]), is derived on Table 6.

Abbreviations:

–	Not applicable.	HI	Hazard index (sum of the HQs).	µg	Microgram.
%	Percent.	HQ	Hazard quotient.	mg	Milligram.
cm^2	Square centimeter.	hr	Hour.	NA	Toxicity value not available or not applicable.
CSF	Cancer slope factor.	IUR	Inhalation unit risk.	RfC	Reference concentration.
ELCR	Excess lifetime cancer risk.	kg	Kilogram.	RfD	Reference dose.
EPCs	Exposure point concentration in soil.	m^3	Cubic meter.		

Table 12
Risk and Hazard Calculations for a Hypothetical Future Site Worker for Exposure to Surface Soil
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Equations:
Equations are presented in Table 3, and summarized below.
Exposure parameters are presented in Table 5.
Constituent-specific toxicity values (CSF, IUR, RfC, RfD) are presented in Table 8 through Table 11.

ELCRo = (EPCs × RBF × FI × IRs × EF × ED × CSFo) / (1,000,000 mg/kg × BW × ATc)
ELCRd = (EPCs × SSAs × SAR × ABSd × EF × ED × CSFa) / (1,000,000 mg/kg × BW × ATc)
ELCRi = (EPCs × ET × CF × EF × ED × IUR × 1000 µg/mg) / ([PEF or VF] × ATc)

HQo = (EPCs × RBF × FI × IRs × EF × ED) / (1,000,000 mg/kg × BW × ATnc × RfDo)
HQd = (EPCs × SSAs × SAR × ABSd × EF × ED) / (1,000,000 mg/kg × BW × ATnc × RfDa)
HQi = (EPCs × ET × CF × EF × ED) / ([PEF or VF] × ATnc × RfC)

Variable	Acronym	Value	Unit	Source
Averaging time, cancer	ATc	25,550	days	See Table 5
Averaging time, non-cancer	ATnc	9,125	days	See Table 5
Body weight	BW	80	kg	See Table 5
Exposure time	ET	4	hrs/day	See Table 5
Exposure frequency	EF	50	days/year	See Table 5
Exposure duration	ED	25	years	See Table 5
Conversion factor (days/hr)	CF1	0.042	days/hr	See Table 5
Fraction ingested from site	FI	1	unitless	See Table 5
Ingestion rate of soil	IRs	50	mg/day	See Table 5
Relative bioavailability factor	RBF	100 for most; 60 for arsenic	percent	See Table 5
Soil-to-skin adherence rate	SAR	0.12	mg/cm²/day	See Table 5
Skin surface area for soil contact	SSAs	3,527	cm²	See Table 5

Total Risk or Hazard							Total ELCR			7E-06	100%	Total HI			0.06	100%

Notes:

[a] Only detected constituents of concern are presented.
[b] The UCLs were calculated using United States Environmental Protection Agency (USEPA) ProUCL version 5.1.00 (USEPA 2016b). See Table 3.
[c] Dermal absorption efficiency (ABSd) for uptake of constituents from a soil matrix (unitless) (USEPA 2021b).
[d] Relative bioavailability factor is constituent-specific; default of 100% (i.e., 1) unless otherwise indicated (unitless).
RBF for arsenic in soil was set at 60% (i.e., 0.6) consistent with USEPA recommendations (USEPA 2021b).
[e] The volatilization factor for soil ([VF] identified with [V]), is derived in Table 7, while the particulate emission factor ([PEF] identified with [P]), is derived on Table 6.

Abbreviations:

–	Not applicable.	HI	Hazard index (sum of the HQs).	µg	Microgram.
%	Percent.	HQ	Hazard quotient.	mg	Milligram.
cm^2	Square centimeter.	hr	Hour.	NA	Toxicity value not available or not applicable.
CSF	Cancer slope factor.	IUR	Inhalation unit risk.	RfC	Reference concentration.
ELCR	Excess lifetime cancer risk.	kg	Kilogram.	RfD	Reference dose.
EPCs	Exposure point concentration in soil.	m^3	Cubic meter.		

Table 13
Risk and Hazard Calculations for a Hypothetical Future Adolescent Trespasser for Exposure to Surface Soil
Railroad Right of Way
Former Philadelphia Coke Plant Site
Philadelphia, Pennsylvania

Equations:
Equations are presented in Table 3, and summarized below.
Exposure parameters are presented in Table 5.
Constituent-specific toxicity values (CSF, IUR, RfC, RfD) are presented in Table 8 through Table 11.

ELCRo = (EPCs × RBF × ADAF × FI × IRs × EF × ED × CSFo) / (1,000,000 mg/kg × BW × ATc)
ELCRd = (EPCs × ADAF × SSAs × SAR × ABSd × EF × ED × CSFa) / (1,000,000 mg/kg × BW × ATc)
ELCRi = (EPCs × ADAF × ET × CF × EF × ED × IUR × 1000 µg/mg) / ([PEF] × ATc)

HQo = (EPCs × RBF × FI × IRs × EF × ED) / (1,000,000 mg/kg × BW × ATnc × RfDo)
HQd = (EPCs × SSAs × SAR × ABSd × EF × ED) / (1,000,000 mg/kg × BW × ATnc × RfDa)
HQi = (EPCs × ET × CF × EF × ED) / ([PEF] × ATnc × RfC)

Variable	Acronym	Value	Unit	Source
Averaging time, cancer	ATc	25,550	days	See Table 5
Averaging time, non-cancer	ATnc	3,285	days	See Table 5
Body weight	BW	65	kg	See Table 5
Exposure time	ET	2	hrs/day	See Table 5
Exposure frequency	EF	50	days/year	See Table 5
Exposure duration	ED	9	years	See Table 5
Conversion factor (days/hr)	CF1	0.042	days/hr	See Table 5
Fraction ingested from site	FI	1	unitless	See Table 5
Ingestion rate of soil	IRs	50	mg/day	See Table 5
Relative bioavailability factor	RBF	100 for most; 60 for arsenic	percent	See Table 5
Age-Dependent Adjustment Factor	ADAF	1.9 for mutagens	unitless	See Table 5
Soil-to-skin adherence rate	SAR	0.07	mg/cm²/day	See Table 5
Skin surface area for soil contact	SSAs	6,032	cm²	See Table 5

Legend:

● = Complete Exposure Pathway.

◐ = Potentially Complete Exposure Pathway.

○ = Incomplete Exposure Pathway.

-- = Not applicable.

NOTES:

Exposure pathway completeness is evaluated based on current and probable future use of the railroad right-of-way (RR ROW).

[a] Exposure route is complete for trespassers accessing the RR ROW without authorization (including recreational use).

[b] Exposure route is complete for outdoor workers conducting grounds/maintence work in the RR ROW.

[c] Exposure route is incomplete because the RR ROW is currently and will be zoned for non-residential use in the future, any unauthorized access is evaluated under trespasser scenario.

[d] Exposure route is complete for utility workers installing subsurface utilities (e.g., stormwater piping, electrical, communication). However, there are no active utilities in the RR ROW, and any work that has the potential to disturb subsurface soil and groundwater will be performed in accordance with the project-specific HASP, as outlined in HHRA Subsection 2.3.2.2.

[e] Exposure route is incomplete due to an easement that must permit continuous operation of the railroad, there are no current buildings or probable future building plans in the RR ROW.

[f] Exposure route will be incomplete due to an Environmental Covenant that will prohibit onsite groundwater use.

Only compounds detected in one or more samples are shown in this table.
1. Industrial RSLs obtained from USEPA Regional Screening Levels - November 2021 available at: <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
   Key: c = cancer; m = ceiling limit exceeded; n = noncancer; R = relative bioavailability factor (RBA) applied; s = Csat exceeded;
   * = where: n SL < 100X c SL; and ** = where n SL < 10X c SL;
2. Exceedances of the Industrial RSLs are bold and shaded.
3. Surrogate values were used for constituents that did not have a industrial RSLs as follows:
   m-xylene for m&p-Xylenes; 4-methylphenol for 3-Methylphenol, 4-Methylphenol; acenaphthene for acenaphthylene; pyrene for phenanthrene,
   chromium VI for total chromium; manganese (non-diet) used for manganese; chlordane for trans-chlordane; endosulfan sulfate for endosulfan II.
4. There are no screening levels for essential nutrients calcium, magnesium, potassium and sodium.
5. All concentrations are in units of mg/kg

Abbreviations:
mg/kg = milligrams per kilogram.
NA = Not available, not analyzed.

Data Qualifier Definitions:
B = Analyte is an estimated value between the instrument detection limit and the Reporting Limit.
D = Concentration is based on a diluted sample analysis.
J = Analyte is an estimated value.

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
Number of Detects	6	Number of Non-Detects	3
Number of Distinct Detects	6	Number of Distinct Non-Detects	3
Minimum Detect	0.046	Minimum Non-Detect	0.026
Maximum Detect	1	Maximum Non-Detect	0.039
Variance Detects	0.14	Percent Non-Detects	33.33%
Mean Detects	0.269	SD Detects	0.374
Median Detects	0.093	CV Detects	1.388
Skewness Detects	2.058	Kurtosis Detects	4.248
Mean of Logged Detects	-1.994	SD of Logged Detects	1.214

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.694	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.788	Detected Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.322	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.325	Detected Data appear Normal at 5% Significance Level

Detected Data appear Approximate Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

KM Mean	0.188	KM Standard Error of Mean	0.11
KM SD	0.301	95% KM (BCA) UCL	0.366
95% KM (t) UCL	0.393	95% KM (Percentile Bootstrap) UCL	0.369
95% KM (z) UCL	0.369	95% KM Bootstrap t UCL	1.572
90% KM Chebyshev UCL	0.518	95% KM Chebyshev UCL	0.667
97.5% KM Chebyshev UCL	0.875	99% KM Chebyshev UCL	1.282

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	0.568	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.718	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.278	**Kolmogorov-Smirnov GOF**
5% K-S Critical Value	0.342	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only			
k hat (MLE)	0.862	k star (bias corrected MLE)	0.542
Theta hat (MLE)	0.312	Theta star (bias corrected MLE)	0.496
nu hat (MLE)	10.35	nu star (bias corrected)	6.508
Mean (detects)	0.269		
Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates			
Minimum	0.01	Mean	0.183
Maximum	1	Median	0.053
SD	0.323	CV	1.765
k hat (MLE)	0.539	k star (bias corrected MLE)	0.433
Theta hat (MLE)	0.339	Theta star (bias corrected MLE)	0.422
nu hat (MLE)	9.702	nu star (bias corrected)	7.802
Adjusted Level of Significance (β)	0.0231		
Approximate Chi Square Value (7.80, α)	2.621	Adjusted Chi Square Value (7.80, β)	2.032
95% Gamma Approximate UCL (use when n>=50)	0.544	95% Gamma Adjusted UCL (use when n<50)	0.702
Estimates of Gamma Parameters using KM Estimates			
Mean (KM)	0.188	SD (KM)	0.301
Variance (KM)	0.0907	SE of Mean (KM)	0.11
k hat (KM)	0.39	k star (KM)	0.334
nu hat (KM)	7.024	nu star (KM)	6.016
theta hat (KM)	0.482	theta star (KM)	0.563
80% gamma percentile (KM)	0.295	90% gamma percentile (KM)	0.547
95% gamma percentile (KM)	0.831	99% gamma percentile (KM)	1.559
Gamma Kaplan-Meier (KM) Statistics			
Approximate Chi Square Value (6.02, α)	1.648	Adjusted Chi Square Value (6.02, β)	1.214

Lognormal GOF Test on Detected Observations Only			
Shapiro Wilk Test Statistic	0.88	**Shapiro Wilk GOF Test**	
5% Shapiro Wilk Critical Value	0.788	Detected Data appear Lognormal at 5% Significance Level	
Lilliefors Test Statistic	0.225	**Lilliefors GOF Test**	
5% Lilliefors Critical Value	0.325	Detected Data appear Lognormal at 5% Significance Level	
Detected Data appear Lognormal at 5% Significance Level			

Lognormal ROS Statistics Using Imputed Non-Detects			
Mean in Original Scale	0.181	Mean in Log Scale	-3.044
SD in Original Scale	0.323	SD in Log Scale	1.845
95% t UCL (assumes normality of ROS data)	0.382	95% Percentile Bootstrap UCL	0.38
95% BCA Bootstrap UCL	0.466	95% Bootstrap t UCL	1.362
95% H-UCL (Log ROS)	8.315		
Statistics using KM estimates on Logged Data and Assuming Lognormal Distribution			
KM Mean (logged)	-2.546	KM Geo Mean	0.0784
KM SD (logged)	1.195	95% Critical H Value (KM-Log)	3.688
KM Standard Error of Mean (logged)	0.436	95% H-UCL (KM -Log)	0.76
KM SD (logged)	1.195	95% Critical H Value (KM-Log)	3.688
KM Standard Error of Mean (logged)	0.436		
DL/2 Statistics			
DL/2 Normal		**DL/2 Log-Transformed**	
Mean in Original Scale	0.185	Mean in Log Scale	-2.728
SD in Original Scale	0.321	SD in Log Scale	1.464
95% t UCL (Assumes normality)	0.384	95% H-Stat UCL	1.819
DL/2 is not a recommended method, provided for comparisons and historical reasons			
Nonparametric Distribution Free UCL Statistics			
Detected Data appear Approximate Normal Distributed at 5% Significance Level			
Suggested UCL to Use			
95% KM (t) UCL	0.393		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% H-UCL	42.68		
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Nonparametric Distribution Free UCL Statistics

Detected Data appear Approximate Lognormal Distributed at 5% Significance Level

Suggested UCL to Use

99% KM (Chebyshev) UCL	34.89		

Warning: Recommended UCL exceeds the maximum observation

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

APPENDIX Q

Vapor Barrier Specification (Basis of Design, but Subject to Change)

VAPORBLOCK® PLUS™ VBP20

UNDER-SLAB VAPOR / GAS BARRIER

RAVEN

PRODUCT DESCRIPTION

VaporBlock® Plus™ is a seven-layer co-extruded barrier made using high quality virgin-grade polyethylene and EVOH resins to provide unmatched impact strength as well as superior resistance to gas and moisture transmission. VaporBlock® Plus™ 20 is more than 100 times less permeable than typical high-performance polyethylene vapor retarders against Methane, Radon, and other harmful VOCs. Tested and verified for unsurpassed protection against BTEX, HS, TCE, PCE, methane, radon, other toxic chemicals and odors.

VaporBlock® Plus™ 20 multi-layer gas barrier is manufactured with the latest EVOH barrier technology to mitigate hazardous vapor intrusion from damaging indoor air quality, and the safety and health of building occupants. VBP20 is one of the most effective underslab gas barriers in the building industry today far exceeding ASTM E-1745 (Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill Under Concrete Slabs) Class A, B and C requirements. Available in a 20 (Class A) mil thicknesses designed to meet the most stringent requirements. VaporBlock® Plus™ 20 is produced within the strict guidelines of our ISO 9001 Certified Management System.

PRODUCT USE

VaporBlock® Plus™ 20 resists gas and moisture migration into the building envelop when properly installed to provide protection from toxic/harmful chemicals. It can be installed as part of a passive or active control system extending across the entire building including floors, walls and crawl spaces. When installed as a passive system it is recommended to also include a ventilated system with sump(s) that could be converted to an active control system with properly designed ventilation fans.

VaporBlock® Plus™ 20 works to protect your flooring and other moisture-sensitive furnishings in the building's interior from moisture and water vapor migration, greatly reducing condensation, mold and degradation.

SIZE & PACKAGING

VaporBlock® Plus™ 20 is available in 10' x 150' rolls to maximize coverage. All rolls are folded on heavy-duty cores for ease in handling and installation. Other custom sizes with factory welded seams are available based on minimum volume requirements. Installation instructions and ASTM E-1745 classifications accompany each roll.

Under-Slab Vapor/Gas Retarder

PRODUCT	PART #
VaporBlock® Plus™ 20	VBP20

APPLICATIONS

- Radon Barrier
- Methane Barrier
- VOC Barrier
- Brownfields Barrier
- Vapor Intrusion Barrier
- Under-Slab Vapor Retarder
- Foundation Wall Vapor Retarder

VAPORBLOCK® PLUS™ VBP20

UNDER-SLAB VAPOR / GAS BARRIER

PROPERTIES	TEST METHOD	VAPORBLOCK® PLUS™ 20 IMPERIAL	VAPORBLOCK® PLUS™ 20 METRIC
Appearance		White/Gold	
Thickness, Nominal		20 mil	0.51 mm
Weight		102 lbs/MSF	498 g/m^2
Classification	ASTM E 1745	CLASS A, B & C	
[3] Tensile Strength	ASTM E 154 Section 9 (D-882)	58 lbf	102 N
Impact Resistance	ASTM D 1709	2600 g	
Permeance (new material)	ASTM E 154 Section 7 ASTM E 96 Procedure B	0.0098 Perms grains/(ft^2·hr·in·Hg)	0.0064 Perms g/(24hr·m^2·mm Hg)
Permeance (after conditioning) (same measurement as above permeance)	ASTM E 154 Section 8, E96 Section 11, E96 Section 12, E96 Section 13, E96	0.0079 0.0079 0.0097 0.0113	0.0052 0.0052 0.0064 0.0074
WVTR	ASTM E 96 Procedure B	0.0040 grains/hr-ft^2	0.0028 gm/hr-m^2
Benzene Permeance	See Note [6]	1.13 x 10^{-10} m^2/sec or 3.62 x 10^{-13} m/s	
Toluene Permeance	See Note [6]	1.57 x 10^{-10} m^2/sec or 1.46 x 10^{-13} m/s	
Ethylbenzene Permeance	See Note [6]	1.23 x 10^{-10} m^2/sec or 3.34 x 10^{-14} m/s	
M & P-Xylenes Permeance	See Note [6]	1.17 x 10^{-10} m^2/sec or 3.81 x 10^{-14} m/s	
O-Xylene Permeance	See Note [6]	1.10 x 10^{-10} m^2/sec or 3.43 x 10^{-14} m/s	
Hydrogen Sulfide	See Note [9]	1.92E^{-09} m/s	
Trichloroethylene (TCE)	See Note [6]	7.66 x 10^{-11} m^2/sec or 1.05 x 10^{-14} m/s	
Perchloroethylene (PCE)	See Note [6]	7.22 x 10^{-11} m^2/sec or 1.04 x 10^{-14} m/s	
Radon Diffusion Coeffiecient	K124/02/95	< 1.1 x 10^{-13} m^2/s	
Methane Permeance	ASTM D 1434	3.68E^{-12} m/s Gas Transmission Rate (GTR): 0.32 mL/m^2•day•atm	
Maximum Static Use Temperature		180° F	82° C
Minimum Static Use Temperature		- 70° F	- 57° C

[3] Tests are an average of machine and transverse directions.
[5] Raven Industries performs seam testing at 20" per minute.
[6] Aqueous Phase Film Permeance.
Permeation of Volatile Organic Compounds through EVOH Thin Film Membranes and Coextruded LLDPE/EVOH/LLDPE Geomembranes, McWatters and Rowe, Journal of Geotechnical and Geoenvironmental Engineering© ASCE/ September 2015. (Permeation is the Permeation Coefficient adjusted to actual film thickness - calculated at 1 kg/m^3.) The study used to determine PCE and TCE is titled: Evaluation of diffusion of PCE & TCE through high performance geomembranes by Di Battista and Rowe, Queens University 8 Feb 2018.
[9] The study used to determine diffusion coefficients is titled: Hydrogen Sulfide (H_2S) Transport through Simulated Interim Covers with Conventional and Co-Extruded Ethylene-Vinyl Alcohol (EVOH) Geomembranes.

VaporBlock® Plus™ Placement

All instructions on architectural or structural drawings should be reviewed and followed.

Detailed installation instructions accompany each roll of VaporBlock® Plus™ and can also be located at www.ravenefd.com.

ASTM E-1643 also provides general installation information for vapor retarders.

VaporBlock® Plus™ UNDERSLAB VAPOR RETARDER / GAS BARRIER

VaporBlock® Plus™ is a seven-layer co-extruded barrier made using high quality virgin-grade polyethylene and EVOH resins to provide unmatched impact strength as well as superior resistance to gas and moisture transmission.
