Report Certification

I certify that to the best of my knowledge:

- Testing data and all corresponding information have been checked for accuracy and completeness.
- Sampling and analysis have been conducted in accordance with the approved protocol and applicable reference methods (as applicable).
- All deviations, method modifications, or sampling and analytical anomalies are summarized in the appropriate report narrative(s).
- This report contains a total of 926 pages - including coversheet, table of contents and certification pages.

EMISSION COMPLIANCE STUDY

1.0 INTRODUCTION

TRC Environmental Corporation (TRC) performed a comprehensive emission test program on two Simple Cycle Combustion Turbines (CTs) (Units 1 and 2) at Georgia Power-Plant McIntosh in Rincon, GA beginning the week of 12 September 2022. The test program was conducted in response to the EPA's Section 114 Information Collection Request (ICR) letter issued to Ms. Rosa Chi, Air Manager, Environmental Affairs of Georgia Power. This emission testing program was completed in accordance with the methods and procedures presented in Enclosure 1 of 40 CFR, Part 63, Subpart YYYY and in accordance with technical discussion between representative EPA Officials, Georgia Power, and TRC. The Test Protocol dated August 31, 2022, was provided to the Georgia Department of Natural Resources, Environmental Protection Division and EPA officials although not required by rule.

1.2 Facility and Process Description

The McIntosh Combustion Turbine-Electric Generating Plant includes 8 diffusion-flame, simple-cycle combustion turbines permitted to burn both natural gas and No. 2 fuel oil. Each CT has a power rating of 80 MW. The photo provided below shows the two CTs (CT Unit 1 and CT Unit 2) selected for testing.

2.0 SUMMARY OF RESULTS

The results of this test program are summarized in the tables below. Detailed individual run results are presented in Section 6.0.

3.0 DISCUSSION OF RESULTS

No major problems were encountered with the test equipment or procedures during the test program. Source operation was normal during the entire test program. No changes or problems were encountered that required modification of any procedures presented in the test plan.

Matrix spike recovery for HF and HCL was challenging as expected but was met for both the Method 320 spiking and Method 301 validation testing requirements. TRC utilized dedicated high-density polyethylene (HDPE) tubing to deliver the HF and HCL gas to the sample probe for recovery through the sample lines and silconert gas regulators were used.

Due to safety considerations and possible impacts from Hurricane Ian, Georgia Power decided on Monday, 26 September 2022 to discontinue the ICR testing after Tuesday, 27 September 2022. The TRC Test team demobilized equipment and traveled away from the site on Wednesday, 28 September 2022 while the plant turned its attention to storm preparedness. All ICR testing was completed for CT1 and all ICR testing was completed for CT2 except for two Method 29 test runs on gas and two Method 29 test runs on oil. Notice of these activities was provided from Rosa Chi of GA Power to Melanie King, Nick Hutson and Kevin McGinn of EPA following notice by phone.

4.0 SAMPLING AND ANALYSIS PROCEDURES

All testing, sampling, analytical, and calibration procedures used for this test program were performed in accordance with the methods presented in the following sections. Where applicable, the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods, USEPA 600/R-94/038c, September 1994 was used to supplement procedures.

4.1 Determination of Sample Point Locations by USEPA Method 1

Sampling was conducted at the main sample platform. Samples were collected from each of the 12 Method 1 traverse points during each test run. For instrumental testing, an initial O₂ stratification test using Method 7E procedures was performed. Once the absence of O₂ stratification was confirmed, sampling for CO, CH₂O, HCL, HF, O₂, CO₂ and moisture was conducted from a single point in one test port. Manual method testing including sampling at all appropriate traverse points defined by Method 1.

4.2 Volumetric Flow Rate Determination by USEPA Method 2

This method is applicable for the determination of the average velocity and the volumetric flow rate of a gas stream.

The gas velocity head (DP) and temperature were measured at traverse points defined by USEPA Method 1. The velocity head was measured with a Type S (Stausscheibe or reverse type) pitot tube and oil-filled manometer; and the gas temperature was measured with a Type K thermocouple. The average gas velocity in the flue was calculated based on: the gas density (as determined by USEPA Methods 3A and 4); the flue gas pressure; the average of the square roots of the velocity heads at each traverse point, and the average flue gas temperature.

4.3 Determination of the Concentration of Gaseous Pollutants Using a Multi-Pollutant Sampling System

Concentrations of the pollutants in the following sub-sections were determined using one sampling system. The number of points at which sample was collected was determined in accordance with 40CFR60 specifications.

4.3.1 CO₂ Determination by USEPA Method 3A

This method is applicable for the determination of CO₂ concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The CO₂ analyzer was equipped with a non-dispersive infrared (IR) detector.

4.3.2 O₂ Determination by USEPA Method 3A

This method is applicable for the determination of O₂ concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The O₂ analyzer was equipped with a paramagnetic-based detector.

4.3.3 CO Determination by USEPA Method 10

This method is applicable for the determination of CO concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The non-dispersive infrared analyzer (NDIR) CO analyzer was equipped with an internal gas correlation filter wheel, which eliminates potential detector interference. As such, use of an interference removal trap was not required.

4.4 Moisture Determination by USEPA Method 4

This method is applicable for the determination of the moisture content of stack gas.

A gas sample was extracted at a constant rate from the source. Moisture was removed from the sample stream by a series of pre-weighed impingers immersed in an ice bath. A minimum of 21 dry standard cubic feet of flue gas was collected during each sample run.

4.5 Moisture Determination by USEPA Method 320.

Per Section 16.3 of Method 4, this method is an applicable alternative for the determination of the moisture content of stack gas. Please refer to Section 4.4 for additional detail.

4.6 Filterable PM Determination by USEPA Method 5

This method is applicable for the determination of PM emissions from stationary sources. USEPA Methods 2-4 were performed concurrently with, and as an integral part of, these determinations.

Flue gas was withdrawn isokinetically from the source at traverse points determined per USEPA Method 1, and PM was collected in the nozzle, probe liner, and on a glass fiber filter. The probe liner and filter were maintained at a temperature of $120 \pm 14^{\circ}\text{C}$ ($248 \pm 25^{\circ}\text{F}$). The PM mass, which included any material that condensed at or above filtration temperature, was determined gravimetrically after the removal of uncombined water.

4.7 Trace Metals Determination by USEPA Method 29

This method is applicable for the determination of metals emissions from stationary sources. This method may be used to determine particulate emissions in addition to the metals emissions if the prescribed procedures and precautions are followed. USEPA Methods 2-4 were performed concurrently with, and as an integral part of these determinations.

Flue gas was withdrawn isokinetically from the source at traverse points determined per USEPA Method 1 through a nozzle, probe liner, glass fiber filter and a series of impingers. The probe liner and filter were maintained at a temperature of $120 \pm 14^{\circ}\text{C}$ ($248 \pm 25^{\circ}\text{F}$). Particle-bound metals were collected in the nozzle, probe on the filter. Gaseous metals were collected in a solution of nitric acid and hydrogen peroxide (analyzed for all metals including Hg) and a solution of acidified potassium permanganate (analyzed only for Hg).

The recovered samples were analyzed using the techniques identified in the appended analytical report.

4.8 Formaldehyde Determination by USEPA Method 320

This method applies to the analysis of vapor phase organic or inorganic compounds which absorb energy in the mid-infrared spectral region, about 400 to 4000 cm^{-1} (25 to $2.5\mu\text{m}$). This method is used to determine compound-specific concentrations in a multi-component vapor phase sample, which is contained in a closed-path gas cell. Spectra of samples are collected using double beam infrared absorption spectroscopy. A computer program is used to analyze spectra and report compound concentrations.

A Spectrum WaveRunIR™ FTIR spectrometer was used for this test program. This device utilizes a liquid nitrogen-cooled, 2-color detector (MCT/InSb sandwich) and a 10.6 meter heated fixed-path sample cell. The 2-color detector has much better sensitivity than traditional detectors in the 2200 - 5000 cm^{-1} region where formaldehyde absorbs. The spectral resolution is 0.5 cm^{-1} (wavenumbers). The instrument was calibrated using a digital library of reference spectra, and all measurements and analytical results were recorded and stored digitally.

Flue gas was transported to the analyzer via a heated, extractive sample system with temperature maintained greater than 250°F . After assembly and warm-up, the sample system was checked for leaks by capping the end of the sample probe and verifying that no sample flowed through the system via an in-line rotameter.

Instrument and sample system responses to calibration gas were verified on-site using:

1. A calibration transfer standard (CTS) gas (ppm-range Ethylene in nitrogen),
2. A Nitrogen zero gas,
3. A CH_2O gas standard with a tracer component (ppm-range sulfur hexafluoride in nitrogen)
4. A HCL gas standard with a tracer component (ppm-range sulfur hexafluoride in nitrogen)
5. A HF gas standard with a tracer component (ppm-range sulfur hexafluoride in nitrogen)

Matrix spiking using the tracer components was also performed and EPA Method 301 Validation testing was completed for each FTIR test parameter for both Natural Gas and Fuel Oil Firing Conditions. Those data are provided in the Quality Assurance Data Appendix.

The FTIR Classical Least Squares (CLS) approach was used to calculate the concentrations of target compounds on a wet basis and the residual, which is the error associated with each reported concentration. If the measured concentration was less than the minimum detection limit (MDL), the value is considered a non-detect and is reported as "<MDL".

TRC also implemented the following procedures from the Electric Power Research Institute (EPRI) document “FTIR Field Test Protocol” which specifically applies to low-level formaldehyde testing at CT sources:

- Use an FTIR instrument with a demonstrated formaldehyde detection limit less than approximately 1/3 of the compliance level.
- Use clean sampling equipment (heated probe/filter, sample line and pump manifold) to minimize system bias.
- Verify stability of the FTIR and sample system via periodic baseline checks prior to the first test run.
- Confirm that the FTIR pressure sensor measures correctly at the test location by comparing to a calibrated barometer.
- Use FTIR scan durations of 5 minutes with backgrounds measured for 10 minutes.
- Generate and analyze a Source Specific Water Standard during the test program. This Standard matched the moisture level moisture of the turbine emission matrix to within $\pm 10\%$. The resulting spectrum was incorporated into the FTIR analytical method to minimize water interference.
- Determine instrument Detection Limit (DL) using 3 times the standard deviation of 8 consecutive direct measurements of zero gas for the same duration as the source measurements (3-5 minutes). Apply the same approach to determine in-stack DL.
- Use formaldehyde gases for calibration and spiking with certified accuracy of $\pm 5\%$.
- Perform Formaldehyde spiking once for each CT tested with a dilution ratio exceeding 10:1. If the concentration of formaldehyde in the exhaust gas is below the in-stack DL, the spike concentration was approximately 50% of the applicable standard.
- Measure a final background spectrum at the conclusion of the test. The final spectrum was used to correct test data if background deviations observed during the test are greater than $\pm 5\%$ in an analytical region (absorbance of 0.021 to - 0.022).

The analysis was confirmed by manual subtraction of the measured compounds from a representative spectrum. This confirmation served to validate the computerized FTIR analysis.

5.0 QUALITY ASSURANCE PROCEDURES

TRC integrates our Quality Management System (QMS) into every aspect of our testing service. We follow the procedures specified in current published versions of the test Method(s) referenced in this report. Any modifications or deviations are specifically identified in the body of the report. We routinely participate in independent, third-party audits of our activities, and maintain:

- Accreditation from the Louisiana Environmental Laboratory Accreditation Program (LELAP).
- Accreditation from the Stack Testing Accreditation Council (STAC) and the American Association for Laboratory Accreditation (A2LA) that our operations conform with the requirements of ASTM D 7036 as an Air Emission Testing Body (AETB).

These accreditations demonstrate that our systems for training, equipment maintenance and calibration, document control and project management will fully ensure that project objectives are achieved in a timely and efficient manner with a strict commitment to quality.

All calibrations are performed in accordance with the test Method(s) identified in this report. If a Method allows for more than one calibration approach, or if approved alternatives are available, the calibration documentation in the appendices specifies which approach was used. All measurement devices are calibrated or verified at set intervals against standards traceable to the National Institute of Standards and Technology (NIST). NIST traceability information is available upon request.

ASTM D7036-04 specifies that: *“AETBs shall have and shall apply procedures for estimating the uncertainty of measurement. Conformance with this section may be demonstrated by the use of approved test protocols for all tests. When such protocols are used, reference shall be made to published literature, when available, where estimates of uncertainty for test methods may be found.”* TRC conforms with this section by using approved test protocols for all tests.

Qualified Individual Certificate(s)

American Association for Laboratory Accreditation

Accredited Air Emission Testing Body

TRC ENVIRONMENTAL CORPORATION

A2LA has accredited

In recognition of the successful completion of the joint A2LA and Stack Testing Accreditation Council (STAC) evaluation process, this laboratory is accredited to perform testing activities in compliance with ASTM D7036:2004 - Standard Practice for Competence of Air Emission Testing Bodies.

Presented this 26th day of March 2021.

Vice President, Accreditation Services
For the Accreditation Council
Certificate Number 3711.01
Valid to May 31, 2023

This accreditation program is not included under the A2LA ILAC Mutual Recognition Arrangement.

This is to Certify that:

Jason Grizzle

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 2H, 3, 3B, 4, 5, 5A, 5B, 5D, 5E, 5F, 5i, 17, 19, 201A, and 202.

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed a comprehensive examination for the test methods designated above.

This certification is effective until:

07-22-2027

Edward J MacKinnon
Air Measurements Practice Quality Manager

Date of Issue: 07-26-2022

Certificate Number: 01856

This certificate is the exclusive property of TRC and is non-transferable.

This is to Certify that:

Jason Grizzle

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 3A, 6C, 7E, 10, 10B, 19, 20, 25A.

CEM Performance Specifications PS2, PS3, PS4, PS4A, PS5, PS6, PS7, PS8, and PS15

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed a comprehensive examination for the test methods designated above.

This certification is effective until:

11-24-2026

Edward J MacKinnon
Air Measurements Practice Quality Manager

Date of Issue: 11-29-2021

Certificate Number: 01751

This certificate is the exclusive property of TRC and is non-transferable.

This is to Certify that:

Jason Grizzle

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 320 and 321

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed an internal comprehensive examination for the test methods designated above.

This certification is effective until:

01-31-2025

Date of Issue:

02-04-2020

Certificate Number:

01538

Edward MacKinnon
Air Measurements Practice Quality Manager

This certificate is the exclusive property of TRC and is non-transferable.

This is to Certify that:

William McKibben

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 1, 2, 3, 4, 12, 19, 29, 30B, 101, 101A, 102, and ASTM D6784-02.

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed a comprehensive examination for the test methods designated above.

This certification is effective until:

03-23-2026

Edward J MacKinnon
Air Measurements Practice Quality Manager

Date of Issue: 03-26-2021

Certificate Number: 01694

This certificate is the exclusive property of TRC and is non-transferable.

K-Factor Isokinetic Sampling Coefficient (based on pre-test data)

$$\text{K-Factor} = 846.72 \times (D_n)^4 \times \Delta H_{@I} \times C_p^2 \times (1-B_{ws})^2 \times \frac{(M_d \times T_m \times P_s)}{(M_s \times T_s \times (P_{bar} + (\Delta H_{@I}/13.6)))}$$

Where:

T_s = Temperature of effluent gas ($^{\circ}\text{R}$)

T_m = Average dry test meter temperature ($^{\circ}\text{R}$)

D_n = Nozzle Diameter (in.)

$\Delta H_{@I}$ = Orifice pressure drop corresponding to 0.75 cfm meter flow rate (in. H_2O)

C_p = Pitot Tube Coefficient (dimensionless)

B_{ws} = Effluent gas fractional moisture content (dimensionless)

M_d = Dry molecular weight of exhaust (lb/lb-mole)

M_s = Molecular weight of exhaust, wet basis (lb/lb-mole)

P_s = Absolute flue gas pressure ("Hg)

P_{bar} = Ambient barometric pressure at sample elevation ("Hg)

D_n =	0.233	in.	P_s =	29.74	in. Hg abs.
$\Delta H_{@I}$ =	1.90	in. H_2O	M_s =	27.83	lb/lb-mole

Wet Molecular Weight

$$M_s = M_d \times (1 - B_{ws}) + (18.015 \times B_{ws})$$

Where:

M_s = Effluent gas molecular weight (lb/lb-mole, wet basis)

B_{ws} = Effluent gas fractional moisture content (dimensionless)

$$M_d = \underline{29.15} \text{ lb/lb-mole} \quad B_{ws} = \underline{0.115}$$

$$M_s = \underline{27.87} \text{ lb/lb-mole}$$

Effluent Gas Pressure

$$P_s = P_{bar} + (P_g/13.6)$$

Where:

P_s = flue gas pressure ("Hg)

P_{bar} = Ambient barometric pressure at sample elevation ("Hg)

P_g = Flue gas gauge pressure ("H₂O)

$$P_{bar} = \underline{29.90} \text{ "Hg} \quad P_g = \underline{-1.50} \text{ "H}_2\text{O}$$

$$P_s = \underline{29.79} \text{ "Hg}$$

Average Meter Temperature

$$T_m = \frac{\sum_{i=1}^n (T_{mini} + T_{mouti})/2}{n}$$

Where:

T_m = Average dry test meter temperature (°R)

T_{min} = Temperature of gas entering dry test meter (°R)

T_{mout} = Temperature of gas leaving dry test meter (°R)

$$\text{Avg } T_{min} = \underline{542.2} \text{ °R} \quad \text{Avg } T_{mout} = \underline{537.4} \text{ °R}$$

Sample Volume at Standard Conditions

$$V_{m(std)} = (T_{std}/29.92) \times Y \times V_m \times (P_{bar} + \Delta H/13.6)/T_m$$

Where:

$V_{m(std)}$ = Sample volume collected corrected to 29.92 inHg and 527.67°R (ft³, dry basis)

Y = Dry test meter calibration coefficient (dimensionless)

V_m = Sample volume collected at actual conditions (ft³, dry basis)

T_{std} = Standard Temperature 527.67(°R)

ΔH = Average pressure differential across calibrated orifice ("H₂O)

$$Y = \frac{1.011}{29.90}$$

$$P_{bar} = \frac{29.90}{539.8} \text{ "Hg}$$

$$T_m = \frac{539.8}{527.67} \text{ °R}$$

Average Duct Velocity

$$V_s = 85.49 \times C_p \times \text{Sqrt } \Delta P \text{ (avg)} \times (T_s / (P_s \times M_s))^{1/2}$$

Where:

V_s = Average velocity of effluent gas (ft/sec)

C_p = Pitot calibration coefficient (dimensionless)

Sqrt ΔP (avg) = Average of the square roots of DP's at all traverse points

$$C_p = \underline{0.827}$$

$$T_s = \underline{1396.4} \text{ °R}$$

$$M_s = \underline{27.87} \text{ lb/lb-mole}$$

Method 2 Volumetric Flow Rate (Actual Basis)

$$Q = V_s \times A \times 60$$

Where:

Q = Effluent gas volumetric flow rate at actual conditions (ft³/min)

A = Cross-sectional area of duct at sample location (ft²)

$$V_s = \underline{143.07} \text{ ft/sec}$$

$$A = \underline{188.692} \text{ ft}^2$$

$$Q = \underline{1,619,777} \text{ cfm}$$

Method 2 Volumetric Flow Rate (Standard Basis)

$$Q_{std} = \frac{T_{std} \times Q \times P_s}{T_s \times 29.92}$$

Where:

Q_{std} = Effluent gas volumetric flow rate corrected to 29.92 inHg and 527.67°R (ft³/min)

$$Q = \frac{1619777}{1396.4} \text{ cfm}$$

$$P_s = \underline{29.79} \text{ "Hg}$$

$$T_s = \underline{1396.4} \text{ °R}$$

$$Q_{std} = \underline{609,424} \text{ scfm}$$

Method 2 Volumetric Flow Rate (Standard Dry Basis)

$$Q_{std(dry)} = Q_{std} \times (1 - B_{ws})$$

Where:

Q_{std(dry)} = Effluent gas volumetric flow rate corrected to 29.92 inHg and 527.67°R (ft³/min, dry basis)

$$Q_{std} = \underline{609424} \text{ scfm}$$

$$B_{ws} = \underline{0.115}$$

$$Q_{std(dry)} = \underline{539,485} \text{ dscfm}$$

Isokinetic Variation:

$$I = \frac{0.0945 \times T_s \times V_{m(std)} \times 527.67}{V_s \times \theta \times A_n \times P_s \times (1 - B_{ws}) \times T_{std}}$$

Where:

I = Percent of isokinetic sampling (dimensionless)

θ = Total sample collection time (min)

A_n = Cross-sectional area of nozzle (ft²)

$$T_s = \underline{1396.4} \text{ °R}$$

$$V_s = \underline{143.071} \text{ ft/sec}$$

PM Concentration - example for filterable only:

$$C_s = \frac{m_n \times 0.01543}{V_{m(std)}}$$

Where:

C_s = Particulate matter concentration (grains/dry standard ft³)

m_n = Net mass of particulate matter collected (mg)

$$m_n = \underline{3.2} \text{ mg}$$

$$V_{m(std)} = \underline{206.334} \text{ dscf}$$

$$C_s = \underline{0.00024} \text{ gr/dscf}$$

PM Concentration in Exhaust Gas (gr/dscf or mg/std. m³), corrected to 15% O₂ - example for filterable only:

$$C_{corr.} = C_s \times \left(\frac{20.9 - \text{Reference O}_2}{20.9 - \% \text{O}_2} \right)$$

Where:

Reference O₂ = 15% O₂

C_s = As-measured PM concentration (gr/dscf or mg/std. m³)

% O₂ = As-measured flue gas O₂ content (% volume)

$$C_s = \underline{0.00024} \text{ gr/dscf}$$

$$\% \text{O}_2 = \underline{14.8} \text{ \% vol}$$

$$C_{corr.} = \underline{0.00023} \text{ gr/dscf @ 15\% O}_2$$

PM Emission Rate Based on Method 2 Volumetric Flow Rate - example for filterable only:

$$ER_{M2} = \frac{C_s \times Q_{std(dry)} \times 60}{7000}$$

Where:

ER_{M2} = Particulate matter emission rate calculated using Method 2 volumetric flow rate (lb/hr)

7000 = grains per pound

$$C_s = \underline{0.0002} \text{ gr/dscf}$$

$$Q_{std(dry)} = \underline{539485} \text{ dscf/min}$$

$$ER_{M2} = \underline{1.09} \text{ lb/hr}$$

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative 140-28983-1

Receipt

The samples were received on 9/28/2022 7:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.1° C.

Receipt Exceptions

The following sample was listed on the Chain of Custody (COC); however, no sample was received: UNIT_1-5-29_NG_RUN2_CONT 5B (140-28983-13).

Metals

Multi-Metals Train Preparation and Analysis

These stack gas samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0006 which is based on EPA SW-846 Method 0060, "Determination of Metals in Stack Emissions" and Method 29, "Determination of Metals Emissions from Stationary Sources". SW-846 Methods 6010C and 7470A as incorporated in Eurofins TestAmerica Knoxville standard operating procedures KNOX-MT-0007 and KNOX-MT-0009 were used to perform the final instrument analysis.

Acid digestion was performed on the front half particulate filter and the acetone and nitric acid probe rinse fractions separately using HNO₃ and HF. After digestion, the HF was sequestered using H₃BO₃ followed by another heating cycle. These digestates were combined, adjusted to final volume and analyzed by ICP. A portion of the ICP digestate was prepared for CVAA analysis in order to determine the particle-bound mercury. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L) x (Final Volume Hg Digestate, mL / Volume ICP Digestate Used, mL)

The 5%HNO₃/10%H₂O₂ impinger samples were reduced in volume to 100 mL. A 20 milliliter portion of the concentrated sample was removed and processed for mercury. The remaining 80 mL of concentrated sample was digested using HNO₃ and H₂O₂, adjusted to a final volume of 80 mL, and analyzed by ICP. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume ICP Digestate, mL / Volume Conc. Sample Digested, mL)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume Hg Digestate, mL / Volume Conc. Sample Digested, mL)

For the 0.1N HNO₃ rinse samples (empty impingers), a 2.5 milliliter portion of the sample as received was removed and processed for mercury.

The 4% KMnO₄/10%H₂SO₄ impinger samples were filtered to remove MnO₂, followed by removal of a 25 mL portion of filtrate for mercury processing. The filtered MnO₂ residue was digested in HCl, combined with the HCl rinse sample and analyzed for mercury.

Results for the 0.1N HNO₃ rinse samples and the KMnO₄ filtrate were calculated using the following equation:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Results for the combined MnO₂ residue HCl digestates and HCl rinse samples were calculated as follows:

$$\text{Hg, } \mu\text{g/sample} = (\text{Raw Sample Concentration, } \mu\text{g/L}) \times (\text{Bench DF}) \times (\text{Total Sample Volume, L} + \text{MnO}_2 \text{ HCl Volume, L}) \times (\text{Final Volume Hg Digestate, mL} / \text{Volume Sample Digested, mL})$$

Note: The total sample volume for the 5%HNO₃/10%H₂O₂ impinger samples is the final volume of the concentrated sample. The total sample volume for the combined MnO₂ residue HCl digestates and HCl rinse samples is equal to the total sample volume plus the MnO₂ HCl volume.

Method 29/6010C: The following samples were diluted due to the presence of Silicon which interferes with Arsenic, Cobalt, Lead, Nickel and Selenium: UNIT_1-5-29_NG_RUN1_CONT 1,2,3 (140-28983-3), UNIT_1-5-29_NG_RUN2_CONT 1,2,3 (140-28983-10), UNIT_1-5-29_NG_RUN3_CONT 1,2,3 (140-28983-17), UNIT_1-5-29_NG_RUN4_CONT 1,2,3 (140-28983-24), UNIT_1-5-29_NG_RUN5_CONT 1,2,3 (140-28983-31), UNIT_1-5-29_NG_RUN6_CONT 1,2,3 (140-28983-38) and UNIT_1-5-29_NG_RUN7_CONT 1,2,3 (140-28983-45). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Total Particulates: The measurement of the mass of particulate matter trapped by the particulate filter and probe rinse derived from an M-5 sampling train was performed using SOP number KNOX-WC-0006 (based on EPA Methods 0050 and 5). Microfiber filters and 150 mL beakers are carefully inspected and tare weighed to constant weight. After sample collection, the filters are dried, and then carefully weighed to constant weight to determine the mass of particulate matter trapped on the filters. The acetone probe rinse solution is evaporated to dryness, and then weighed to constant weight to determine the total particulate mass collected in the rinse. The total particulate mass collected by an M-5 train is the sum of the particulate filter and the acetone probe rinse residue weights.

Method 5: Filter samples UNIT_1-5-29_NG_RUN1_CONT 1 (140-28983-1), UNIT_1-5-29_NG_RUN2_CONT 1 (140-28983-8), UNIT_1-5-29_NG_RUN3_CONT 1 (140-28983-15), UNIT_1-5-29_NG_RUN4_CONT 1 (140-28983-22), UNIT_1-5-29_NG_RUN5_CONT 1 (140-28983-29) and UNIT_1-5-29_NG_RUN6_CONT 1 (140-28983-36) arrived with significant damage (tears/bends) and results may exhibit a low bias.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

- * If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is \geq zero, subsequent calculations are performed using that value.
- * If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is $<$ zero, subsequent calculations are performed using a value of 1 mg
- * If filter material was not recovered in the acetone rinse, and the result from the lab for either fraction is $<$ zero, subsequent calculations are performed using a value of 0.5 mg for that fraction

** - the maximum allowable blank correction is 0.0079 mg/ml

TRC Report Number 491281

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Receipt

The samples were received on 9/28/2022 7:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.1° C.

Receipt Exceptions

Both the COC and label list the container as 10, HNO₃-H₂O₂ reagent blank should be container 9, Logged as container 9.BLANK_HNO₃-H₂O₂_CONT 9 (140-28988-53)

Metals

Multi-Metals Train Preparation and Analysis

These stack gas samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0006 which is based on EPA SW-846 Method 0060, "Determination of Metals in Stack Emissions" and Method 29, "Determination of Metals Emissions from Stationary Sources". SW-846 Methods 6010C and 7470A as incorporated in Eurofins TestAmerica Knoxville standard operating procedures KNOX-MT-0007 and KNOX-MT-0009 were used to perform the final instrument analysis.

Acid digestion was performed on the front half particulate filter and the acetone and nitric acid probe rinse fractions separately using HNO₃ and HF. After digestion, the HF was sequestered using H₃BO₃ followed by another heating cycle. These digestates were combined, adjusted to final volume and analyzed by ICP. A portion of the ICP digestate was prepared for CVAA analysis in order to determine the particle-bound mercury. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L) x (Final Volume Hg Digestate, mL / Volume ICP Digestate Used, mL)

The 5% HNO₃/10% H₂O₂ impinger samples were reduced in volume to 100 mL. A 20 milliliter portion of the concentrated sample was removed and processed for mercury. The remaining 80 mL of concentrated sample was digested using HNO₃ and H₂O₂, adjusted to a final volume of 80 mL, and analyzed by ICP. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume ICP Digestate, mL / Volume Conc. Sample Digested, mL)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume Hg Digestate, mL / Volume Conc. Sample Digested, mL)

For the 0.1N HNO₃ rinse samples (empty impingers), a 2.5 milliliter portion of the sample as received was removed and processed for mercury.

The 4% KMnO₄/10% H₂SO₄ impinger samples were filtered to remove MnO₂, followed by removal of a 25 mL portion of filtrate for mercury processing. The filtered MnO₂ residue was digested in HCl, combined with the HCl rinse sample and analyzed for mercury.

Results for the 0.1N HNO₃ rinse samples and the KMnO₄ filtrate were calculated using the following equation:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Results for the combined MnO₂ residue HCl digestates and HCl rinse samples were calculated as follows:

$$\text{Hg, } \mu\text{g/sample} = (\text{Raw Sample Concentration, } \mu\text{g/L}) \times (\text{Bench DF}) \times (\text{Total Sample Volume, L} + \text{MnO}_2 \text{ HCl Volume, L}) \times (\text{Final Volume Hg Digestate, mL} / \text{Volume Sample Digested, mL})$$

Note: The total sample volume for the 5% HNO_3 /10% H_2O_2 impinger samples is the final volume of the concentrated sample. The total sample volume for the combined MnO_2 residue HCl digestates and HCl rinse samples is equal to the total sample volume plus the MnO_2 HCl volume.

Method 29/6010C: The following samples were diluted due to the presence of Silicon which interferes with Arsenic, Cobalt, Lead, Nickel and Selenium: UNIT_1-5-29_FO_RUN1-CONT 1,2,3 (140-28988-3), UNIT_1-5-29_FO_RUN2-CONT 1,2,3 (140-28988-10), UNIT_1-5-29_FO_RUN3-CONT 1,2,3 (140-28988-17), UNIT_1-5-29_FO_RUN4-CONT 1,2,3 (140-28988-24), UNIT_1-5-29_FO_RUN5-CONT 1,2,3 (140-28988-31), UNIT_1-5-29_FO_RUN6-CONT 1,2,3 (140-28988-38) and UNIT_1-5-29_FO_RUN7-CONT 1,2,3 (140-28988-45). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Total Particulates: The measurement of the mass of particulate matter trapped by the particulate filter and probe rinse derived from an M-5 sampling train was performed using SOP number KNOX-WC-0006 (based on EPA Methods 0050 and 5). Microfiber filters and 150 mL beakers are carefully inspected and tare weighed to constant weight. After sample collection, the filters are dried, and then carefully weighed to constant weight to determine the mass of particulate matter trapped on the filters. The acetone probe rinse solution is evaporated to dryness, and then weighed to constant weight to determine the total particulate mass collected in the rinse. The total particulate mass collected by an M-5 train is the sum of the particulate filter and the acetone probe rinse residue weights.

Method 5: Filter samples UNIT_1-5-29_FO_RUN1-CONT 1 (140-28988-1), UNIT_1-5-29_FO_RUN4-CONT 1 (140-28988-22) and UNIT_1-5-29_FO_RUN6-CONT 1 (140-28988-36) arrived with significant damage (tears/bends) and results may exhibit a low bias.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

*Total Filterable PM, m_n, (milligrams):	1.85	6.59	4.67	1.57	

* If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is \geq zero, subsequent calculations are performed using that value.

* If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is $<$ zero, subsequent calculations are performed using a value of 1 mg

* If filter material was not recovered in the acetone rinse, and the result from the lab for either fraction is $<$ zero, subsequent calculations are performed using a value of 0.5 mg for that fraction

** - the maximum allowable blank correction is 0.0079 mg/ml

TRC Report Number 491281

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Receipt

The samples were received on 9/28/2022 7:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.1° C.

Metals

Multi-Metals Train Preparation and Analysis

These stack gas samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0006 which is based on EPA SW-846 Method 0060, "Determination of Metals in Stack Emissions" and Method 29, "Determination of Metals Emissions from Stationary Sources". SW-846 Methods 6010C and 7470A as incorporated in Eurofins TestAmerica Knoxville standard operating procedures KNOX-MT-0007 and KNOX-MT-0009 were used to perform the final instrument analysis.

Acid digestion was performed on the front half particulate filter and the acetone and nitric acid probe rinse fractions separately using HNO₃ and HF. After digestion, the HF was sequestered using H₃BO₃ followed by another heating cycle. These digestates were combined, adjusted to final volume and analyzed by ICP. A portion of the ICP digestate was prepared for CVAA analysis in order to determine the particle-bound mercury. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L) x (Final Volume Hg Digestate, mL / Volume ICP Digestate Used, mL)

The 5%HNO₃/10%H₂O₂ impinger samples were reduced in volume to 100 mL. A 20 milliliter portion of the concentrated sample was removed and processed for mercury. The remaining 80 mL of concentrated sample was digested using HNO₃ and H₂O₂, adjusted to a final volume of 80 mL, and analyzed by ICP. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume ICP Digestate, mL / Volume Conc. Sample Digested, mL)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume Hg Digestate, mL / Volume Conc. Sample Digested, mL)

For the 0.1N HNO₃ rinse samples (empty impingers), a 2.5 milliliter portion of the sample as received was removed and processed for mercury.

The 4% KMnO₄/10%H₂SO₄ impinger samples were filtered to remove MnO₂, followed by removal of a 25 mL portion of filtrate for mercury processing. The filtered MnO₂ residue was digested in HCl, combined with the HCl rinse sample and analyzed for mercury.

Results for the 0.1N HNO₃ rinse samples and the KMnO₄ filtrate were calculated using the following equation:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Results for the combined MnO₂ residue HCl digestates and HCl rinse samples were calculated as follows:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L + MnO₂ HCl Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Note: The total sample volume for the 5%HNO₃/10%H₂O₂ impinger samples is the final volume of the concentrated sample. The total

sample volume for the combined MnO₂ residue HCl digestates and HCl rinse samples is equal to the total sample volume plus the MnO₂ HCl volume.

Method 29/6010C: The following samples were diluted due to the presence of Silicon which interferes with Arsenic, Cobalt, Lead, Nickel and Selenium: UNIT_2-5-29_NG_RUN1_CONT 1,2,3 (140-29043-3), UNIT_2-5-29_NG_RUN2_CONT 1,2,3 (140-29043-10), UNIT_2-5-29_NG_RUN3_CONT 1,2,3 (140-29043-17), UNIT_2-5-29_NG_RUN4_CONT 1,2,3 (140-29043-24), UNIT_2-5-29_NG_RUN5_CONT 1,2,3 (140-29043-31) and FTB-5-29_NG_CONT 1,2,3 (140-29043-38). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Total Particulates: The measurement of the mass of particulate matter trapped by the particulate filter and probe rinse derived from an M-5 sampling train was performed using SOP number KNOX-WC-0006 (based on EPA Methods 0050 and 5). Microfiber filters and 150 mL beakers are carefully inspected and tare weighed to constant weight. After sample collection, the filters are dried, and then carefully weighed to constant weight to determine the mass of particulate matter trapped on the filters. The acetone probe rinse solution is evaporated to dryness, and then weighed to constant weight to determine the total particulate mass collected in the rinse. The total particulate mass collected by an M-5 train is the sum of the particulate filter and the acetone probe rinse residue weights.

Method 5: Filter samples UNIT_2-5-29_NG_RUN3_CONT 1 (140-29043-15), UNIT_2-5-29_NG_RUN4_CONT 1 (140-29043-22) and UNIT_2-5-29_NG_RUN5_CONT 1 (140-29043-29) arrived with significant damage (tears/bends) and results may exhibit a low bias.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Filterable Particulate Sample Analysis Summary

Project#: **491281**
 Company: **Georgia Power**
 Plant: **McIntosh Plant**

Unit ID: **CT Unit 2 - FO**
 Location: **Exhaust**
 Test Date(s): **9/26/2022**

Filterable PM	<u>Run 1</u>	<u>Run 2</u>	<u>Run 3</u>	<u>Run 4</u>	<u>Blank</u>
Filter material collected in acetone rinse?	N	N	N	N	
Filter final - Filter tare (mg):	1.00	1.09	-0.38	-0.20

*Total Filterable PM, m_n, (milligrams):	1.40	1.77	3.15	1.46	

* If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is \geq zero, subsequent calculations are performed using that value.

* If filter material was recovered in the acetone rinse, and the sum of the filter weight increase and the total rinse mass is $<$ zero, subsequent calculations are performed using a value of 1 mg

* If filter material was not recovered in the acetone rinse, and the result from the lab for either fraction is $<$ zero, subsequent calculations are performed using a value of 0.5 mg for that fraction

** - the maximum allowable blank correction is 0.0079 mg/ml

TRC Report Number 491281

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Receipt

The samples were received on 9/28/2022 7:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.1° C.

Metals

Multi-Metals Train Preparation and Analysis

These stack gas samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0006 which is based on EPA SW-846 Method 0060, "Determination of Metals in Stack Emissions" and Method 29, "Determination of Metals Emissions from Stationary Sources". SW-846 Methods 6010C and 7470A as incorporated in Eurofins TestAmerica Knoxville standard operating procedures KNOX-MT-0007 and KNOX-MT-0009 were used to perform the final instrument analysis.

Acid digestion was performed on the front half particulate filter and the acetone and nitric acid probe rinse fractions separately using HNO₃ and HF. After digestion, the HF was sequestered using H₃BO₃ followed by another heating cycle. These digestates were combined, adjusted to final volume and analyzed by ICP. A portion of the ICP digestate was prepared for CVAA analysis in order to determine the particle-bound mercury. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L) x (Final Volume Hg Digestate, mL / Volume ICP Digestate Used, mL)

The 5%HNO₃/10%H₂O₂ impinger samples were reduced in volume to 100 mL. A 20 milliliter portion of the concentrated sample was removed and processed for mercury. The remaining 80 mL of concentrated sample was digested using HNO₃ and H₂O₂, adjusted to a final volume of 80 mL, and analyzed by ICP. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume ICP Digestate, mL / Volume Conc. Sample Digested, mL)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume Hg Digestate, mL / Volume Conc. Sample Digested, mL)

For the 0.1N HNO₃ rinse samples (empty impingers), a 2.5 milliliter portion of the sample as received was removed and processed for mercury.

The 4% KMnO₄/10%H₂SO₄ impinger samples were filtered to remove MnO₂, followed by removal of a 25 mL portion of filtrate for mercury processing. The filtered MnO₂ residue was digested in HCl, combined with the HCl rinse sample and analyzed for mercury.

Results for the 0.1N HNO₃ rinse samples and the KMnO₄ filtrate were calculated using the following equation:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Results for the combined MnO₂ residue HCl digestates and HCl rinse samples were calculated as follows:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L + MnO₂ HCl Volume, L) x (Final Volume Hg Digestate, mL / Volume Sample Digested, mL)

Laboratory: Eurofins Knoxville (Continued)

Note: The total sample volume for the 5% HNO_3 /10% H_2O_2 impinger samples is the final volume of the concentrated sample. The total sample volume for the combined MnO_2 residue HCl digestates and HCl rinse samples is equal to the total sample volume plus the MnO_2 HCl volume.

Method 29/6010C: The following samples were diluted due to the presence of Silicon which interferes with Arsenic, Cobalt, Lead, Nickel and Selenium: UNIT_2-5-29_FO_RUN1_CONT 1,2,3 (140-29044-3), UNIT_2-5-29_FO_RUN2_CONT 1,2,3 (140-29044-10), UNIT_2-5-29_FO_RUN3_CONT 1,2,3 (140-29044-17), UNIT_2-5-29_FO_RUN4_CONT 1,2,3 (140-29044-24), UNIT_2-5-29_FO_RUN5_CONT 1,2,3 (140-29044-31), FTB-5-29_FO_CONT 1,2,3 (140-29044-38) and C-1555 M5/M29 MEDIA CHECK FILTER (140-29044-43). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Total Particulates: The measurement of the mass of particulate matter trapped by the particulate filter and probe rinse derived from an M-5 sampling train was performed using SOP number KNOX-WC-0006 (based on EPA Methods 0050 and 5). Microfiber filters and 150 mL beakers are carefully inspected and tare weighed to constant weight. After sample collection, the filters are dried, and then carefully weighed to constant weight to determine the mass of particulate matter trapped on the filters. The acetone probe rinse solution is evaporated to dryness, and then weighed to constant weight to determine the total particulate mass collected in the rinse. The total particulate mass collected by an M-5 train is the sum of the particulate filter and the acetone probe rinse residue weights.

Method 5: Filter samples UNIT_2-5-29_FO_RUN1_CONT 1 (140-29044-1), UNIT_2-5-29_FO_RUN3_CONT 1 (140-29044-15) and UNIT_2-5-29_FO_RUN5_CONT 1 (140-29044-29) arrived with significant damage (tears/bends) and results may exhibit a low bias.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

Job Narrative 140-28988-2

Receipt

The samples were received on 9/28/2022 7:45 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 19.1° C.

Receipt Exceptions

The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. COC not relinquished by client.

Both the COC and label list the container as 10, HNO₃-H₂O₂ reagent blank should be container 9, Logged as container 9.BLANK_HNO₃-H₂O₂_CONT 9 (140-28988-53)

Metals

Multi-Metals Train Preparation and Analysis

These stack gas samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0006 which is based on EPA SW-846 Method 0060, "Determination of Metals in Stack Emissions" and Method 29, "Determination of Metals Emissions from Stationary Sources". SW-846 Methods 6010C and 7470A as incorporated in Eurofins TestAmerica Knoxville standard operating procedures KNOX-MT-0007 and KNOX-MT-0009 were used to perform the final instrument analysis.

Acid digestion was performed on the front half particulate filter and the acetone and nitric acid probe rinse fractions separately using HNO₃ and HF. After digestion, the HF was sequestered using H₃BO₃ followed by another heating cycle. These digestates were combined, adjusted to final volume and analyzed by ICP. A portion of the ICP digestate was prepared for CVAA analysis in order to determine the particle-bound mercury. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume ICP Digestate, L) x (Final Volume Hg Digestate, mL / Volume ICP Digestate Used, mL)

The 5%HNO₃/10%H₂O₂ impinger samples were reduced in volume to 100 mL. A 20 milliliter portion of the concentrated sample was removed and processed for mercury. The remaining 80 mL of concentrated sample was digested using HNO₃ and H₂O₂, adjusted to a final volume of 80 mL, and analyzed by ICP. Results were calculated using the following equations:

ICP Analyte, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume ICP Digestate, mL / Volume Conc. Sample Digested, mL)

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Final Volume Concentrated Sample, L) x (Final Volume Hg Digestate, mL / Volume Conc. Sample Digested, mL)

For the 0.1N HNO₃ rinse samples (empty impingers), a 2.5 milliliter portion of the sample as received was removed and processed for mercury.

The 4% KMnO₄/10%H₂SO₄ impinger samples were filtered to remove MnO₂, followed by removal of a 25 mL portion of filtrate for mercury processing. The filtered MnO₂ residue was digested in HCl, combined with the HCl rinse sample and analyzed for mercury.

Results for the 0.1N HNO₃ rinse samples and the KMnO₄ filtrate were calculated using the following equation:

Hg, µg/sample = (Raw Sample Concentration, µg/L) x (Bench DF) x (Total Sample Volume, L) x (Final Volume Hg Digestate, mL / Volume

Sample Digested, mL)

Results for the combined MnO₂ residue HCl digestates and HCl rinse samples were calculated as follows:

$$\text{Hg, } \mu\text{g/sample} = (\text{Raw Sample Concentration, } \mu\text{g/L}) \times (\text{Bench DF}) \times (\text{Total Sample Volume, L} + \text{MnO}_2 \text{ HCl Volume, L}) \times (\text{Final Volume Hg Digestate, mL} / \text{Volume Sample Digested, mL})$$

Note: The total sample volume for the 5% HNO₃/10% H₂O₂ impinger samples is the final volume of the concentrated sample. The total sample volume for the combined MnO₂ residue HCl digestates and HCl rinse samples is equal to the total sample volume plus the MnO₂ HCl volume.

Method 29/6010C: The method blank for preparation batch 140-67442 contained Chromium above the reporting limit (RL). The entire sample was consumed during extraction; therefore, the data have been reported as found. Reanalysis of the method blank was performed on 11-17-22 and the Chromium result was confirmed.

Method 29/6010C: The following sample was diluted due to the presence of Silicon which interferes with Arsenic, Cobalt, Lead, Nickel and Selenium: BLANK_SAMPLE FILTERS_CONT 12 (140-28988-56). Elevated reporting limits (RLs) are provided.

Method 29/7470A: The following samples were requested for analysis by the client after the holding time had expired: BLANK_HNO₃_CONT 8A (140-28988-51), BLANK_HNO₃-H₂O₂_CONT 9 (140-28988-53), BLANK_KMNO₄-H₂SO₄_CONT 10 (140-28988-54), BLANK_8N-HCL_CONT 11 (140-28988-55) and BLANK_SAMPLE FILTERS_CONT 12 (140-28988-56).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Total Particulates: The measurement of the mass of particulate matter trapped by the particulate filter and probe rinse derived from an M-5 sampling train was performed using SOP number KNOX-WC-0006 (based on EPA Methods 0050 and 5). Microfiber filters and 150 mL beakers are carefully inspected and tare weighed to constant weight. After sample collection, the filters are dried, and then carefully weighed to constant weight to determine the mass of particulate matter trapped on the filters. The acetone probe rinse solution is evaporated to dryness, and then weighed to constant weight to determine the total particulate mass collected in the rinse. The total particulate mass collected by an M-5 train is the sum of the particulate filter and the acetone probe rinse residue weights.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Date: 9/14/22

Maintaining Accuracy:

The accuracy of this instrument has been checked and found to be in tolerance unless otherwise noted. The instrument should provide accurate readings until the next accuracy verification due date. If this instrument is damaged or abused in any way, it should not be used for making measurements until its accuracy is checked and verified to be in tolerance.

Maintaining Accuracy:

The accuracy of this instrument has been checked and found to be in tolerance unless otherwise noted. The instrument should provide accurate readings until the next accuracy verification due date. If this instrument is damaged or abused in any way, it should not be used for making measurements until its accuracy is checked and verified to be in tolerance.

I certify that pitot tube/probe number A10808 meets or exceeds all specifications, criteria and/or applicable design features and is hereby assigned a pitot tube certification factor of 0.84. See 40 CFR Pt. 60, App. A, EPA Method 2.

The factory, geometric calibration performed by Apex Instruments is valid until initial field use by the end user; this is under the assumption that the pitot tube is in the same physical condition as it was when calibrated. The end user may use the purchase date (or placed into service date) as a way to track initial and ensuing annual calibrations. A geometric calibration should be performed following each subsequent field use.

Analyzer Interference Test Data

Analyzer Interference and Manufacturer Stability Tests

In an effort to assist our customers with meeting the requirements of the Instrumental Methods for testing 3A, 6C, 7E, 10, and 20, we are providing a summary of interferences for certain Thermo Fisher Scientific analyzers.

The requirement for conducting analyzer interference checks for potential interfering gases is the responsibility of the testing organizations. The Methods do, however, allow for the manufacturer of instruments to provide this data. Tests are required to be conducted on the same "make and model" as those being used for method testing.

The information contained in the accompanying tables pertains to the "make" of analyzers under the name of Thermo Electron Corporation, Thermo Environmental Instruments, and Thermo Scientific. The "model" of analyzers are: Model 42 for NO, NO₂, NO_x, Model 43 for SO₂, Model 48 for CO, and Model 410 for CO₂. The specific pollutant detection and analytical technology for each of the above listed specific models have remained the same for various series of analyzers manufactured over the past years. Therefore the interference test results shown for the iQ series analyzers in this document would produce essentially the same results for iSeries and earlier series of these models.

The potential interference gas test results shown in the following tables indicate that none of the Thermo Scientific analyzers tested have a collective analytical detection interference that would sum more than 0.5% of the analyzer span value. The acceptance criterion based on Section 13.4 of Method 7E, states that the sum of the responses must not be greater than 2.5% of the analyzer calibration value.

If you have any questions regarding the information contained herein, please do not hesitate to contact us.

Manufacturer's Stability Test

Thermo Fisher Scientific certifies that the 42iQ Series of analyzers and the 48iQ analyzer have been tested in accordance with the USEPA procedures outlined in 40 CFR Part 52.23, as well as Methods 7E and 10, and have the results shown below:

Test Description	Acceptance Criteria	Results: 42iQ Family	Results: 48iQ
Thermal Stability	Drift $\leq 3\%$ of Range @ 80% of Range	Drift $< 2\%$ of Range @ 80% of Range between 0 and 40 C	Drift $< 2\%$ of Range @ 80% of Range between 5 and 45 C
Fault Conditions	Alarm if conditions result in performance outside of compliance	Visible and electronic alarms are a standard feature	
Insensitivity to Supply Voltage Variations	$\pm 10\%$ variation from nominal voltage produces drift $\leq 2\%$ of span @ 80% of Range	$< 1\%$ deviation from span for voltage change from 90 VAC to 130 VAC	
Analyzer Calibration Error	(Response-Span Value) $\leq 2\%$ of Span Value for high, medium and low calibration gas	$< 2\%$ of Calibration Span

1.0 INTRODUCTION

TRC Environmental Corporation (TRC) will perform a comprehensive emission test program on two Simple Cycle Combustion Turbines (CTs) of Units 1-8 at Georgia Power-Plant McIntosh in Rincon, GA beginning the week of 12 September 2022. Similarly, testing will be performed on two Combined Cycle CTs at Georgia Power-Plant McDonough beginning the week of 10 October 2022. The test program is being conducted in response to the emission testing request of EPA's Section 114 Information Collection Request (ICR) letter issued to Ms. Rosa Chi, Air Manager, Environmental Affairs of Georgia Power. This program will be completed in accordance with the methods and procedures presented in Enclosure 1 of 40 CFR, Part 63, Subpart YYYY and in accordance with technical discussion between representative EPA Officials, Georgia Power and TRC.

2.0 FACILITY AND PROCESS DESCRIPTIONS

The McIntosh Combustion Turbine-Electric Generating Plant includes 8 diffusion-flame, simple-cycle combustion turbines permitted to burn both natural gas and No. 2 fuel oil. Each CT has a power rating of 95 MW and maximum rated heat input of 1208 MMBtu/hr.

The McDonough-Atkinson Combined-Cycle Facility includes 3 lean pre-mix, combined-cycle power blocks, which primarily burn natural gas. Each power block is nominally rated at 840 MW and consists of two combustion turbines, two heat recovery steam generators with duct-burners, and one steam turbine. Two of the combustion turbines, CT4A and CT5A, also have the capability to burn ultra-low sulfur diesel as a back-up fuel; therefore, this testing is only required while firing natural gas for these combined-cycle CTs. The site also includes 4 simple-cycle CTs that are not required to be included as part of this testing.

2.1 PROCESS DATA

The process data to be documented during each test run (as applicable) include:

- Fuel type (e.g., natural gas, propane, fuel oil), and heat input (British thermal units per hour (Btu/hr)).
- Actual fuel feed rate during test (based on HHV) and permitted fuel feed rate (based on HHV) (MMBtu/hr). Explanation of the procedure used (e.g., EPA Method 19) to determine the actual fuel feed rate.
- Turbine load (percent).
- Emission unit operating temperature (°F).
- Operating parameters

3.0 TEST REQUIREMENTS

For Plant McIntosh, two distinct, simple cycle CTs within the Units 1-8 block will be selected for testing. Each of the two CTs will be tested during both natural gas and fuel oil firing conditions.

Similarly for Plant McDonough, two distinct, combined-cycle CTs will be selected for testing. Each of the those two CTs will be tested during natural gas firing conditions only. Duct burners may be fired during testing consistent with the YYYY NESHAP.

The following table presents a list of the pollutants and respective test methods to be tested at each plant and point source location:

Test Condition	M320 FTIR ^a (CH ₂ O, HCL & HF)	M10 ^a (CO)	M29 ^b (MMs)	M5 ^b (PM)	M3A ^{ab} (O ₂)	M1-4 ^{ab} (VFR)	Comment

^a test parameters conducted simultaneously; seven 1-hour run durations.

^b test parameters conducted simultaneously; seven 4-hour run durations.

EPA Reference Method (RM) 320 FTIR sampling for formaldehyde, hydrogen chloride (HCl) and hydrogen fluoride (HF) will include all the method-specified quality control procedures. TRC may also implement additional quality procedures from a test protocol published by EPRI to address low-level FTIR measurement of formaldehyde. Those additional procedures would ensure accurate and precise field measurements and minimize bias. The formaldehyde detection limit for the FTIR analyzer will be approximately 30 ppb_{vw} (uncorrected for moisture and O₂). TRC has communicated to Georgia Power and EPA that spiking criterion for HF may be challenging based on previous experience and difficulties associated with the chemical nature of HF. TRC and Georgia Power will report spike recovery and Method 301 validation results for HF whether pass or fail.

Reference Method (RM) 320 sampling for the HAP of formaldehyde and acid gases (HCl and HF) will be performed simultaneously with determination of carbon monoxide (CO) test runs for input to potential development of CO as a surrogate. Carbon monoxide sampling will be performed in accordance with RM10 procedures. Continuous sampling for oxygen (O₂) will be performed in accordance with RM 3A concurrently with RM320 and M10 runs for pollutant correction to 15%O₂. Seven (7) test runs by RM320 and RM10 will be completed and will consist of one-hour duration each run. Volumetric flow rate (VFR) from any concurrent M5/M29 test runs will be used to calculate results in units of pounds per hour (lb/hr) in addition to units of ppm@15%O₂. If M5/M29 test runs are not being performed concurrently with RM320 and RM10, independent flow measurements will be performed.

Sampling for Method 29 HAPS metals consisting of antimony (Sb), arsenic (As), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), lead (Pb), manganese (Mn), mercury (Hg), nickel (Ni), and selenium (Se) will be combined with Method 5. Filterable particulate matter (PM) will be determined from the front-half, filter and probe/nozzle sections of the sampling train. Seven (7), four-hour (4 dscm) test runs will be completed as specified in Enclosure 1 of the Rule. Results from those runs will be corrected to 15%O₂ and concurrent (VFR) will be used to calculate results in units of (lb/hr). TRC plans to implement two separate sampling systems to minimize fuel usage and to provide overall efficiency of testing. One complete sample train will be leak checked and ready to proceed into a subsequent test run following the completion any previous run. Immediately following sampling, the M5/M29 sampling assembly will either be recovered in a TRC mobile laboratory or GA Power's testing support trailer. Each part of the sampling assembly will be collected in appropriate, labeled, sample jars and stored according to method requirements. Each sample will be logged onto a chain of custody document that will be kept with the samples. All samples will be couriered to the contract laboratory for analysis according to all method specifications.

Carbon dioxide (CO₂) will be performed in accordance with EPA RM 3A in conjunction with O₂ sampling for calculation of source gas molecular weight as required for (VFR). EPA Method 4 will be used to determine moisture content of the gas stream during each run. EPA method 4 will be determined from the combined M5/M29 sample trains.

4.0 SPECIFIC TEST PROCEDURES

Detailed test procedures are described in Section 8 of this protocol. Three complete test runs will be performed for each constituent in accordance with the following USEPA methods:

1. Stratification testing to determine the gaseous test point strategy for FTIR parameters and carbon monoxide (CO) will be determined by traverse measurement of oxygen (O₂) in accordance with the procedures defined in Method 7E Section 8.1.2. This approach has been approved by EPA.
2. Volumetric flow will be determined utilizing USEPA Methods 1 and 2. The location of the ports in relation to upstream and downstream disturbances will be measured and recorded. Wind tunnel calibrated pitots with pre-determined coefficients will be used for all flow measurements in lieu of a default coefficient of 0.84. Volumetric flow rate (VFR) data from the Method 5/29 particulate matter/metals sampling will be applied to all FTIR (Method 320- formaldehyde, HCL & HF) and carbon monoxide (CO) bracketed measurements for calculation of emission rates (lb/hr). In any event where FTIR and CO sampling is not bracketed by ongoing M5/M29 test runs, independent flow measurements will be performed.
3. A check for the presence or absence of cyclonic flow will be performed in accordance with Section 11.4 of Method 1 and recorded on the data sheet appended.
4. Oxygen (O₂) and carbon dioxide (CO₂) content of the stack gas will be determined instrumentally on a continuous, online basis by Method 3A during each test run. All 1-hour test runs for CO will be accompanied with online measurement of O₂ and CO₂. As proposed to and approved by EPA, TRC may also collect integrated bag samples with Methods 5/29 and analyzed via calibrated analyzer. Instrument calibration will be verified in accordance with Method 3A procedures when sampling is performed on an online, continuous basis and verified following any analysis of integrated bag samples. Oxygen

measurement data will be bracketed for all pollutant measurements for subsequent calculation of concentration @15%O₂.

5. Moisture tests will be performed in accordance with Method 4 in conjunction with the Method 5/29 PM and Metals sampling.
6. Particulate emissions will be determined in accordance with Method 5. Each test run will be a minimum of 240 minutes in length, or as necessary to collect a minimum of 4 dry standard cubic meters (DSCM) as specified in Enclosure 1 of the YYYY Combustion Turbine NESHAP. Sampling for filterable PM will be performed in the front half of the Method 29 sampling system. A quartz-lined probe and quartz nozzles will be utilized for the tests. TRC will implement a split train assembly through use of a Teflon jumper from the filter exit to the Method 29 metals impingers.
7. HAP metals (antimony (Sb), arsenic (As), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), lead (Pb), manganese (Mn), mercury (Hg), nickel (Ni), and selenium (Se)) will be performed in strict accordance with Method 29 sampling and analytical procedures. The sampling assembly will be combined with Method 5 front-half filterable PM. A quartz-lined probe and quartz nozzles will be utilized for the tests. TRC will implement a split train assembly through use of a Teflon jumper from the filter exit to the Method 29 metals impingers. Analytical detection limits for HAP metals will be reported where applicable.
8. Carbon monoxide (CO) emissions will be determined in accordance with USEPA Method 10 and will be concurrent with all FTIR Method 320 measurements. Each test run will consist of one hour of continuous testing. Detection limits for CO will be reported as 2% of the calibration range.
9. Low-level formaldehyde, hydrogen chloride (HCL) and hydrogen fluoride (HF) emissions will be determined in accordance with Method 320, as described in Section 3 above. Each test will be a minimum one hour in length. Typically, sample delivery systems for HCL and HF are operated at a much higher temperature than that of formaldehyde. Since all three parameters are being evaluated in a single test grouping, TRC will evaluate whether formaldehyde off-gassing is present from the higher temperature setting prior to start of FTIR test runs. If off-gassing of formaldehyde is present, two separate delivery systems may be implemented with separate measurement of formaldehyde from HCL and HF. TRC will spike at 50-150% of the native formaldehyde concentration. If formaldehyde is not detected, TRC will spike at approximately 50% of the NESHAP YYYY emissions limit of 91ppb. For HCL, TRC will spike at approximately 1 ppm concentration if this compound is not detected. If HCL is detected, spiking will be performed at 50-150% of the native concentration. The same approach for HCL spiking will be applied for HF.

TRC plans to perform Method 301 validation spiking according to Section 13.0 of the Method which indicates that validation at one source may also apply to another type of source, if it can be shown that the exhaust gas characteristics are similar at both sources. TRC anticipates that at a minimum, validation testing will be performed at Plant McIntosh on one location while firing oil, but validation testing may also be completed at Plant McIntosh during an oil-firing condition. If validation testing is not completed at Plant McIntosh while firing gas, this would be performed while at Plant McDonough. For any additional test emission points the spiking procedures indicated in Section 9.0 of Method 320 will be performed for HCHO and HCL.

Assists in operation of test trains as required. Performs traversing of manual and instrumental methods.

Technician III:

Assists in operation of test trains and performs traversing of manual and instrumental test methods.

7.0 PLANT REQUIREMENTS

TRC must be supplied with the following items to complete this test program:

1. Safe access to test positions.
2. Electrical power 110 V, 30 A, 60 cycle service at the test locations.
3. Four-inch Six-inch (for M201A) test ports cleaned and loose prior to arrival of test crew.
4. Sufficient lighting at the test site.
5. Plant or pollution control equipment operating data, in the format required by the applicable regulatory agency, for inclusion in the report.
6. Washroom facilities for use by members of the test crew.
7. A shelter at the test location if weather conditions warrant.
8. Stable operations and the required load or production rate during the test period.
9. Communication between the test location and the control room.
10. Parking location to place TRC mobile trailer within 200 feet of sampling locations with access to multiple 110 V, 20 A, 60 cycle or 480 V, 50 A, 60 cycle circuits.

8.0 TEST PROCEDURES

All testing, sampling, analytical, and calibration procedures used for this test program will be performed in accordance with the methods presented in the following sections. Where applicable, the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods, USEPA 600/R-94/038c, September 1994 is used to supplement procedures.

8.1 Determination of Sample Point Locations by USEPA Method 1

This method is applicable to gas streams flowing in ducts, stacks, and flues. It is designed to aid in the representative measurement of pollutant emissions and/or total volumetric flow rates from stationary sources. To qualify as an acceptable sample location, it must be located at a position at least two stack or duct equivalent diameters downstream and a half equivalent diameter upstream from any flow disturbance. The location of the ports in relation to upstream and downstream disturbances will be measured and recorded

The cross-section of the measurement site is divided into a number of equal areas, and the traverse points are then located in the center of these areas. The minimum number of points are determined from either Figure 1-1 (particulate) or Figure 1-2 (non-particulate) of USEPA Method 1.

Prior to performing volumetric flow traverses, a check for the presence or absence of cyclonic flow will be performed in accordance with Section 11.4 of Method 1 and recorded on the data sheet enclosed.

8.2 Volumetric Flow Rate Determination by USEPA Method 2

This method is applicable for the determination of the average velocity and the volumetric flow rate of a gas stream.

The gas velocity head (ΔP) and temperature is measured at traverse points defined by USEPA Method 1. The velocity head is measured with a Type S (Stausscheibe or reverse type) pitot tube and oil-filled manometer; the gas temperature is measured with a Type K thermocouple. The average gas velocity in the flue is calculated based on: the gas density (as determined by Methods 3, 3A, or 3B, and 4), the flue gas pressure, the average of the square roots of the velocity heads at each traverse point, and the average flue gas temperature.

8.3 CO₂ Determination by USEPA Method 3A

This method is applicable for the determination of CO₂ concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The CO₂ analyzer is equipped with a non-dispersive infrared (IR) detector.

8.4 O₂ Determination by USEPA Method 3A

This method is applicable for the determination of O₂ concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The O₂ analyzer is equipped with a paramagnetic-based detector.

8.5 CO Determination by USEPA Method 10

This method is applicable for the determination of CO concentrations in controlled and uncontrolled emissions from stationary sources only when specified within the regulations. The non-dispersive infrared analyzer (NDIR) CO analyzer is equipped with an internal gas correlation filter wheel, eliminating potential detector interference. Therefore, use of an interference removal trap is not required.

8.6 Moisture Determination by USEPA Method 4

This method is applicable for the determination of the moisture content of stack gas.

A gas sample is extracted at a constant rate from the source. Moisture is removed from the sample stream by a series of pre-weighed impingers immersed in an ice bath. A minimum of 21 dry standard cubic feet of flue gas is collected during each sample run.

8.7 Moisture Determination by USEPA Method 320

The Method 320 sampling and measurement system meets the requirements for stack sampling of gaseous organic and inorganic compounds set forth by the United States Environmental Protection Agency (USEPA). In particular, it meets the requirements of USEPA Reference Method 320, "Measurement Of Vapor Phase Organic And Inorganic Emissions By Extractive Fourier Transform Infrared (FTIR) Spectroscopy," 40CFR63. This method applies to the analysis of a range of volatile organic compounds (VOCs) and volatile inorganic compounds emitted from an industrial source.

The source emissions are extracted from the single sampling point in the gas stream and then transported to the FTIR analyzer via a heated, extractive sampling system. The various components of the matrix are identified and quantified by absorbance of infrared radiation. All data measurements and analytical results are stored on computer. The data is copied to Cloud Server, USB drive, or a second hard drive before departing the test site.

Method 320 FTIR testing will utilize a Spectrum Environmental Solutions Extractive (FTIR) monitoring system, WaverunIR-EXT with a gas sampling and conditioning system that has been optimized by TRC. This FTIR instrument is calibrated using a stored spectral library of reference spectra. Calibration is verified on site through direct and system calibration measurements using gas standards. These gases include the method-required CTS (calibration transfer standard, 10 ppm Ethylene) and a nitrogen zero gas. Direct, system and dynamic matrix spiking calibrations will be conducted as previously described.

8.8 Filterable PM Determination by USEPA Method 5

This method is applicable for the determination of particulate matter (PM) emissions from stationary sources. USEPA Methods 2-4 are performed concurrently with, and as an integral part, of these determinations.

Flue gas is withdrawn isokinetically from the source at traverse points determined per USEPA Method 1, and PM is collected in the nozzle, probe liner, and on a glass fiber filter. The probe liner and filter are maintained at a temperature of $120 \pm 14^{\circ}\text{C}$ ($248 \pm 25^{\circ}\text{F}$) or such other temperature as specified by an applicable subpart of the standards, or as approved by the Administrator for a particular application. The PM mass, which includes any material that condenses at or above the filtration temperature, is determined gravimetrically after the removal of uncombined water.

8.9 Trace Metals Determination by USEPA Method 29

This method is applicable to the determination of metals emissions from stationary sources. In addition to the metal's emissions, this method may be used to determine particulate emissions if the prescribed procedures and precautions are followed. Methods 2-4 are performed concurrently with, and as an integral part of, these determinations.

Flue gas is withdrawn isokinetically from the source at traverse points determined per USEPA Method 1 through a nozzle, probe liner, glass fiber filter and a series of impingers. The probe liner and filter are maintained at a temperature of $120 \pm 14^{\circ}\text{C}$ ($248 \pm 25^{\circ}\text{F}$) or such other temperature as specified by an applicable subpart of the standards or approved by the Administrator for a particular application. Particle-bound metals are collected in the nozzle, in the probe, and on the filter. Gaseous metals are collected in a solution of nitric acid and hydrogen peroxide (analyzed for select metals including Hg) and a solution of acidified potassium permanganate (analyzed only for Hg).

The recovered samples are analyzed using the methods specified in Method 29 or such other techniques as specified by an applicable subpart of the standards, or as approved by the Administrator for a particular application.

9.0 QUALITY ASSURANCE PROCEDURES

TRC integrates our Quality Management System (QMS) into every aspect of our testing service. We follow the procedures specified in current published versions of the test Method(s) referenced in this protocol. Any modifications or deviations are specifically identified in the body of this protocol. We routinely participate in independent, third-party audits of our activities and maintain:

- Accreditation from the Louisiana Environmental Laboratory Accreditation Program (LELAP).
- Accreditation from the Stack Testing Accreditation Council (STAC) and the American Association for Laboratory Accreditation (A2LA) that our operations conform with the requirements of ASTM D 7036 as an Air Emission Testing Body (AETB).

These accreditations demonstrate that our systems for training, equipment maintenance and calibration, document control and project management will fully ensure that project objectives are achieved in a timely and efficient manner with a strict commitment to quality.

All calibrations are performed in accordance with the test Method(s) identified in this protocol. If a method allows for more than one calibration approach, or if approved alternatives are available, the calibration documentation in the appendices of the report will specify which approach is used. All measurement devices are calibrated or verified at set intervals against standards traceable to the National Institute of Standards and Technology (NIST). NIST traceability information is available upon request.

Raw data is kept on file at the TRC office performing the sampling. All samples from the test program are retained for 60 days after the submittal of the report, after which they are discarded unless TRC is advised otherwise.

Calculations are performed electronically via spreadsheet application. An explanation of the nomenclature and calculations along with the complete test results will be appended to the report. Also, to be appended to the report are calibration data and copies of the raw field data sheets.

10.0 TEST REPORT

A final test report will be prepared following the completion of the tests. Sample summary tables and spreadsheets are in the appendix. This report shall additionally contain all general reporting requirements specified in ASTM D7036-04, Section 15. The contents of the report will include the following sections, as required:

1.0 INTRODUCTION

1.1 Project Contact Information
